Status of nuclear spectroscopy program at center for exotic nuclear studies

Tuesday, July 18, 2023 3:15 PM (25 minutes)

Center for exotic nuclear study in institute of basic science was recently founded to study fundamental questions in astrophysics and nuclear physics through investigations of radioactive atomic nuclei. The center is composed of four groups experimental nuclear structure, experimental nuclear reaction, experimental nuclear astrophysics and nuclear theory.

In the experimental groups, many detectors are currently under development/planned which can be applied for the nuclear spectroscopic study at the new accelerator facility RAON, such as Clover HPGe detector array (ASGARD), Co-axial Ge detector array, Si detector array (STARK and STARK-Jr), LaBr₃ detector array (KHALA), conversion electron detector array (SCEPTER) and neutron detector array (PANDORA II). Several projects utilizing detectors such as decay station and in-beam gamma-ray spectroscopy have recently started for low-energy branches at RAON. Also, many international collaboration projects are also ongoing such as the IDATEN project utilizing the LaBr₃ detector array from Korea and UK forming the largest LaBr₃ array at RIBF RIKEN. The current status of the detector system development for nuclear spectroscopy and possible setups will be presented.

Primary author: Dr KIM, Yung Hee (Center for Exotic Nuclear Studies, Institute for Basic Science)

Presenter: Dr KIM, Yung Hee (Center for Exotic Nuclear Studies, Institute for Basic Science)

Session Classification: Session 6

Track Classification: Experimental Techniques
