The Structure of Proteins

The amino acid sequence (N→C) of a protein is its **primary structure**

The three-dimensional arrangement of secondary structure elements results in the **tertiary structure** of a protein

Secondary structure: Regions of the amino acid chain adopt certain conformations (α -helix; β -strand)

Quaternary Structure: How protein associate with themselves (multimers, etc) and with other proteins

Page 4 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

Nucleic acids are also biological macromolecules

B-DNA

A-DNA/RNA

Why Study Structural Biology?

The ultimate goal of molecular biology is to understand biological processes in terms of the chemistry and physics of the macromolecules that participate in them. One of the essential differences between the chemistry of living systems and that of the nonliving is the great structural complexity of biological macromolecules. We shall not unravel the chemistry of life in molecular detail without knowing at atomic or close to atomic resolution the structure of biological macromolecules, especially the proteins.

Introduction to Protein Structure, C. Branden & John Tooze, Garland Publishing Inc., 1991

The functionality of proteins and nucleic acids, including their interactions with each other are vital in all living organisms: **malfunction often causes disease**

Page 6 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

MICROSCOPY AND RESOLUTION

In all microscopy techniques what we can see is limited by the wavelength of light used.

$$res_{max} = \lambda / 2$$

To see individual atoms in molecules need to use light with $0.5 \text{ Å} > \lambda > 4.0 \text{ Å}$. Hence the need to use X-rays.

Page 7 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

DIFFRACTION

Diffraction occurs when radiation/light passes through an aperture of similar dimensions to the wavelength of the radiation. Edges of aperture act as secondary sources of radiation and get constructive/destructive interference from 'sources'.

$$n\lambda = 2d \sin \theta$$

Crystals are made up of many identical units – **unit cells** – stacked together in three dimensions. The contents of each unit cell are identical. Crystals act as diffraction gratings for X-rays.

Page 8 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

X-RAY CRYSTALLOGRAPHY

[W.L. Bragg] X-rays are waves 'reflected' by planes in a crystal

$$n\lambda = 2d \sin \theta$$

W.L. Bragg (1912) *Proc. Camb. Phil. Soc.*, XVII (1), pp. 43-57.

Page 9 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

THE FIRST CRYSTAL STRUCTURE

'...results would seem to indicate clearly the association of each diffracting centre with a single atom.'

W. L. Bragg (1913) *The Structure of Some Crystals as Indicated by Their Diffraction of X-rays. Proc. R. Soc. Lond. A* **89**, 248 – 277; doi: 10.1098/rspa.1913.0083

Page 10 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

X-RAY CRYSTALLOGRAPHY

Result: atomic model of macromolecule of interest = atomic coordinates (x,y,z) and displacement factors (B, U_{ij}).

$$\rho(x,y,z) = \frac{1}{V_c} \sum_h \sum_k \sum_l F_{hkl} \exp(-2\pi i(hx + ky + lz))$$

$$F_{hkl} = \sum_j |F_{hkl}| \exp(-2\pi i(\phi))$$

Amplitude Phase

$$|F_{hkl}| \propto \sqrt{I_{hkl}}$$

Page 11 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

RESOLUTION

Crowfoot Hodgkin, D. et al., (1955). Structure of Vitamin B₁₂: The Crystal Structure of the Hexacarboxylic Acid derived from B₁₂ and the Molecular Structure of the Vitamin. *Nature* **176**, 325 – 328.

Myoglobin

Kendrew, J.C. et al., (1958). A three-dimensional model of the myoglobin molecule obtained by x-ray analysis. *Nature* **181**, 662–666.

Page 12 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

DIFFRACTION DATA RESOLUTION

$$E(hkl) = \frac{e^2}{m^2 c^2} \frac{1}{\omega} \frac{1}{V_c} \frac{1}{V_p} |F(h)|^2$$

- For a crystal of a given size, energy of a diffracted beam is:
 - proportional to incident X-ray beam
 - proportional to volume of crystal
 - inversely proportional to square of unit cell volume
- for crystals of macromolecules (large unit cells, small crystals) we need intense sources of X-rays to get maximum information (i.e. data resolution).

SYNCHROTRON RADIATION INTENSE AND HAS A BROAD SPECTRAL RANGE

Fig. 3 Comparison of the brightness of the bending magnet and undulator sources of the Advanced Light Source (ALS) to that of other common light sources.

Bending magnet spectrum

Undulator spectrum

Page 15 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

UNDULATOR SYNCHROTRON RADIATION IS HIGHLY COLLIMATED

$$1/\gamma = mc^2 / E$$

<http://www-ssrl.slac.stanford.edu/primer.pdf>

Intensity + collimation = 'brilliance'

Page 16 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

SYNCHROTRON RADIATION IS IDEAL FOR MACROMOLECULAR CRYSTALLOGRAPHY

- Brilliance at 3rd generation synchrotron sources
 - small, bright x-ray beams (better information from smaller samples)
- Wavelengths from IR to hard X-rays
 - Anomalous dispersion, fluorescence techniques
- Time structure (ps)
 - Time resolved studies

Page 17 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

MONOCHROMATIC MX WITH 2D DETECTORS

$$n\lambda = 2d_{hkl} \sin \theta$$

Rotating the crystal (X) means that the reciprocal lattice also rotates, reciprocal lattice points pass through the surface of the Ewald sphere resulting in diffracted beams.

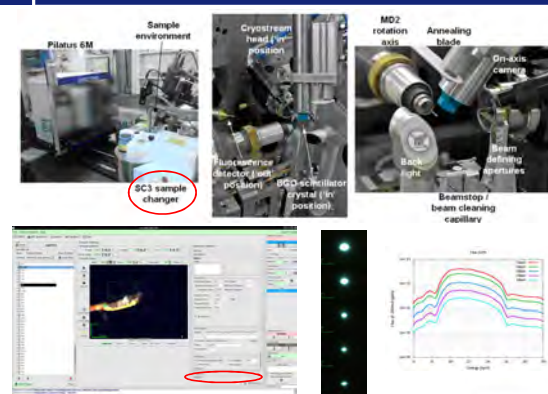

Due to 'denseness' of reciprocal lattice in macromolecules – large unit cells - we can't collect the unique part of the sphere in one large rotation.

Have to break this down into a series of (much) smaller parts (oscillations) - typically (much) smaller than 0.5° (larger for crystals of small molecules) which are added together form the data set

Page 19 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

MECHANISTIC CLUES FROM THE STRUCTURE OF MITOCHONDRIAL COMPLEX I

- Mitochondria gain energy by oxidising hydrogen extracted from nutrients, converting it into a proton gradient that is then used to synthesise (ATP), the universal energy currency of the cell. **Complex I** couples the transfer of two electrons from NADH to ubiquinone with the pumping of four protons across the inner mitochondrial membrane.

- Defects in human complex I are the most frequent cause of inherited mitochondrial disorders and are implicated in numerous neurodegenerative diseases and ageing.

Page 26 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

SMALL MOLECULES ARE ALSO IMPORTANT IN STRUCTURAL BIOLOGY

GNNQQNY peptide crystals 40 μm x 1 μm

Nelson *et al.*, *Nature* (2005) 435, 773

Neurodegenerative diseases are associated with the formation of amyloid fibrils. Spines of these have a common structure. Interface between the two β-sheets is 'dry' (no water molecules). Also no hydrogen bonds from one sheet to its mate. Structure suggests routes towards developing therapies for Alzheimer's and related amyloidoses.

Page 27 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

STRUCTURAL BIOLOGY AT SYNCHROTRONS WITHOUT CRYSTALS - SAXS

Small Angle X-ray Scattering (SAXS) is a technique for studying structure (and other things*) at low resolution in solution & under normal biophysical/biochemical conditions

- Information from SAXS:**
- model independent parameters (R_g , $I(0)$)
 - *ab initio* shape determination
 - rigid body modelling

*molecular shape, molecular interactions, kinetics, etc...

Page 28 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

STUDIES IN SOLUTION CAN SOMETIMES REVEAL THINGS CRYSTALS CAN'T

Radiation damage in X-ray crystallography

Global radiation damage

- **Reciprocal space** – degradation of diffraction properties of a crystal

- Wilson B factor
- Mosaicity
- Relative unit cell volume
- Resolution (Å)

- Before 1990: **room temperature** crystallography requires data from several crystals to obtain a complete dataset

- 1990s: **cryo-crystallography** extends the lifetime of crystals to be able to record a full dataset (or more) on one single crystal (Garman & Schneider, *J. Appl. Cryst.* (1997))

- Even at cryo-temperatures maximum absorbed dose/crystal ~20 - 30MGy

Specific radiation damage

- 2000s: 3rd generation synchrotron sources revealed damage in the **real space**, on specific chemical groups

Adapted from Walk et al., *PNAS* (2000)

- **Specific** radiation damage is a concern in crystallography at **cryogenic temperature**
- The onset of **specific** damage is faster than **global** damage at **cryogenic temperature**
- ➔ Decoupling of the two types of radiation damage

Page 30 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

GLOBAL RADIATION DAMAGE, CRYSTAL SIZE AND DATA SET RESOLUTION

The resolution of a *complete* diffraction dataset that will be yielded from a *single* microcrystal of a biological macromolecule will remain limited by radiation damage. Many such crystals will be required for the collection of even moderate resolution diffraction data

→ New (old) paradigm for macromolecular crystallography: **Multi-crystal data collection**

Or

→ Avoid radiation damage

Page 31 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

The European Synchrotron | ESRF

AVOIDING RADIATION DAMAGE

Radiation damage after exposure to **extremely high X-ray dose** occurs after a time lag of a few 10s of femtoseconds. Can we produce X-ray sources that might allow collection of diffraction data crystal on these timescales?

Neutze, R. et al. (2000). Potential for biomolecular imaging with femtosecond X-ray pulses. *Nature* 406, 752-757.

Page 32 | ESRF-LL Summer School | 20th September 2019 | Gordon Leonard

Page 33 | ESRF-ILL Summer School | 28th September 2019 | Gordon Leonard

X-FELS X-RAY BEAMS ARE MUCH BRIGHTER THAN SYNCHROTRON X-RAY BEAMS

<http://www-ssrl.slac.stanford.edu/stohr/fel-pic.pdf>

Page 34 | ESRF-ILL Summer School | 28th September 2019 | Gordon Leonard

BUT.....

When exposed to X-FEL X-ray beams crystals will vaporise. How can one collect diffraction data? Will one see any diffraction?

Page 35 | ESRF-ILL Summer School | 28th September 2019 | Gordon Leonard

SERIAL FEMTOSECOND CRYSTALLOGRAPHY (X-FELS)

High resolution serial femtosecond crystallography

High resolution femtosecond diffraction of micron-sized lysozyme crystals

Crystals pass through beam in random orientations. Single 'still' image from each crystal. 1000s of images combined to produce a complete data set. I. Schlichting, ESRF Users' Meeting, February 2014

WHAT TO EXPECT FROM ESRF-EBS

The source properties of the current and ESRF-EBS storage ring settings.

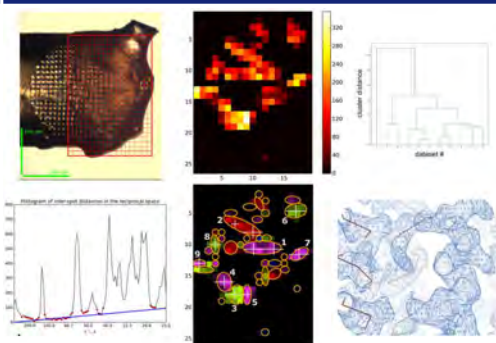

Parameters			Bore size [mm]		SASE		S [mm]		A x A x s [mm]		Divergence [mrad]							
W [nm]	Y [nm]	Y' [mrad]	W	Y	W	Y	W	Y	W	Y	W	Y						
0.45 nm	4	37.2	3	8.2	3.2	409	10.0	14.7	10.3	4.2	1.3	1.3						
													1	3.2	409	5.8	10.0	0.1
													0.2	4	409	4.7	10.3	4.7
0.45 nm	4	1	0.07	8.2	3.2	39	10.0	10.0	10.3	4.2	1.3	1.3						
													1	3.2	40	5.8	10.0	0.1
													0.2	4	40	4.7	10.3	4.7
0.05 nm	2	4.7	2.7	8.2	3.2	26.7	10.0	10.0	10.3	4.2	1.3	1.3						
													1	3.2	40	5.8	10.0	0.1
													0.2	4	40	4.7	10.3	4.7

- Smaller source size
- Lower divergence
- **Smaller X-ray beams**
- **Much brighter beams**
- All straight sections equal
- Higher coherence fraction

Page 45 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

ROOM TEMPERATURE DATA COLLECTION AND PUMP-PROBE INVESTIGATIONS

Room-temperature Data Collection

Crystal structures obtained at cryogenic temperatures can obscure functionally important conformations: i.e. for small GTPase H-ras only the RT structure showed the catalytically essential glutamine residue in the conformation that is required for GTP hydrolysis.

Fraser et al., PNAS 108, 16247-16252, 2011

Because of radiation damage, serial crystallography is (probably) the only route to obtaining RT structures.

Pump-probe *in crystallo*

• Use a pulsed beam to record a series of time points per image.
• Pulsed beam could be generated using very fast shutter (e.g. a chopper).
• Shutter sequence encoded by X matrix (right).
• For in time points in runs are required.

A. Pearson, ESRF UM2016

Page 46 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

TIME-RESOLVED MX USING THE LAUE TECHNIQUE (WHITE/PINK BEAM)

Synchrotron Radiation has a 'pulsed' time structure. In 16- or single-bunch modes we can take advantage of this to probe structural changes in macromolecules using Laue diffraction techniques

Structure of MbCO at different time delays after photolysis. The bound CO dissociates, eventually becoming trapped in sites 4 and 5, where it remains out to the microsecond time scale.

F. Schotte et al., (2003), *Science*, 300, 1944-1947.

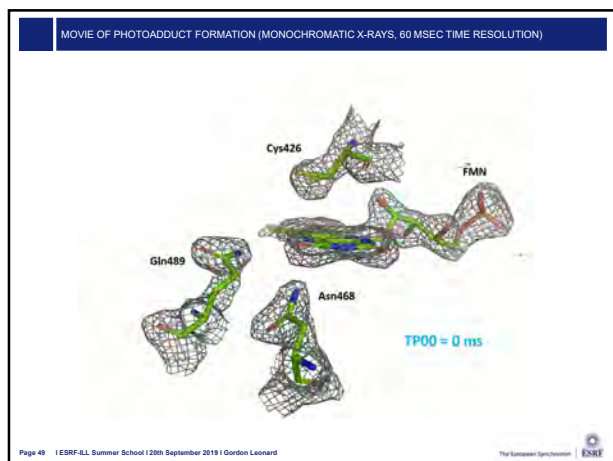

Page 47 | ESRF-ILL Summer School | 20th September 2019 | Gordon Leonard

EBSL8 - A BEAMLINE FOR (TIME-RESOLVED) SERIAL CRYSTALLOGRAPHY

- High flux (10^{16} ph/s), large bandwidth ($\sim 1\%$)
- Beamsize: $0.5 \mu\text{m} - 10 \mu\text{m}$
- Tuneable: 10-30 keV
