

WELCOME TO THE ILL !

Summary

- ILL – 50 years of neutron science
- The neutron source
- Why neutrons?
- Examples of neutron science and applications
- A look to the future

Institut Laue-Langevin – founded in 1967

World leader in neutron science and technology

After more than 40 years, we are still number one

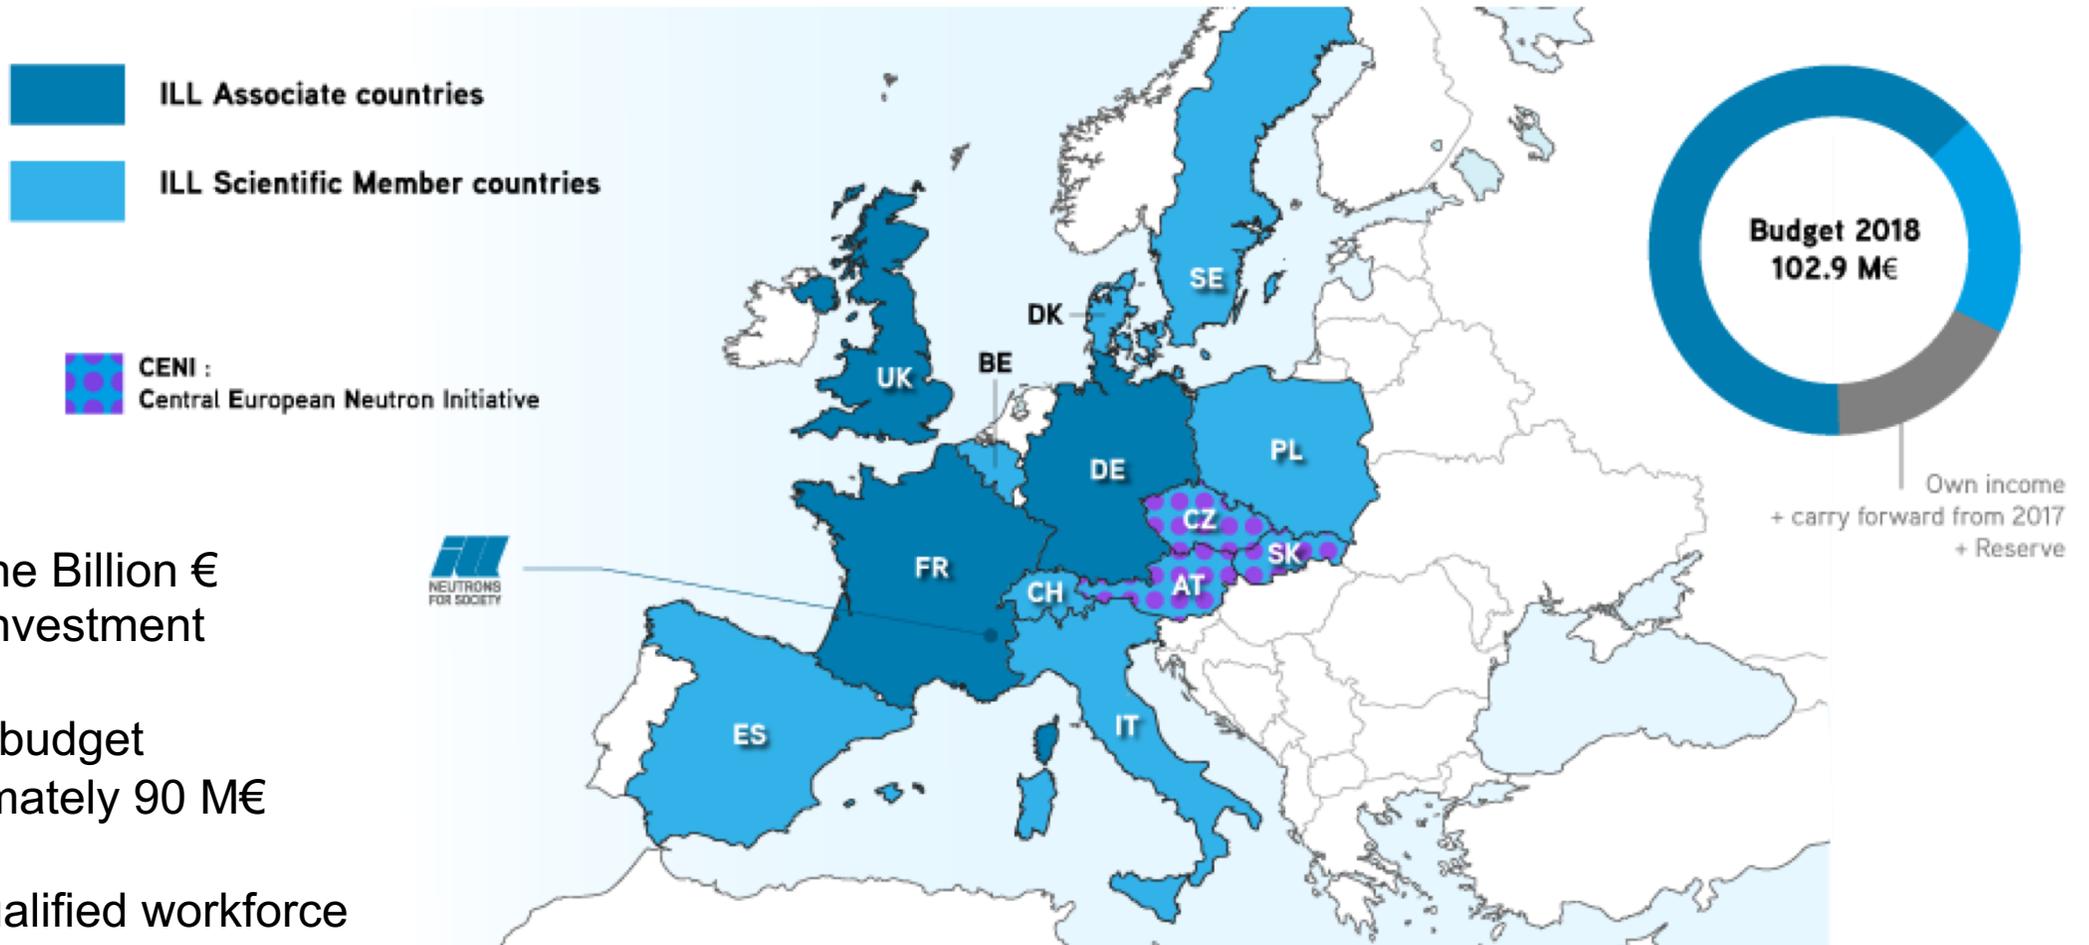

The ILL is the most intense neutron source in the world, at the service of international scientists, to carry out scientific research at the 'frontiers' of modern science.

The ILL Stakeholders

The advent of the scientific members continues the process.

- Close to one Billion € of capital investment
- An annual budget of approximately 90 M€
- A highly qualified workforce of about 500 people

Key Figures

1400 users from an active community of 12 000 scientists

850 experiments/year

650 publications/year

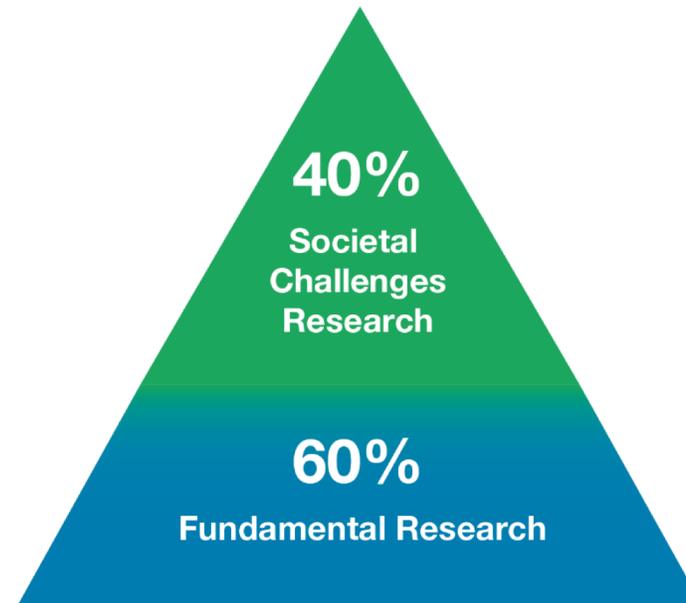

65 countries

28 instruments + 10 CRG

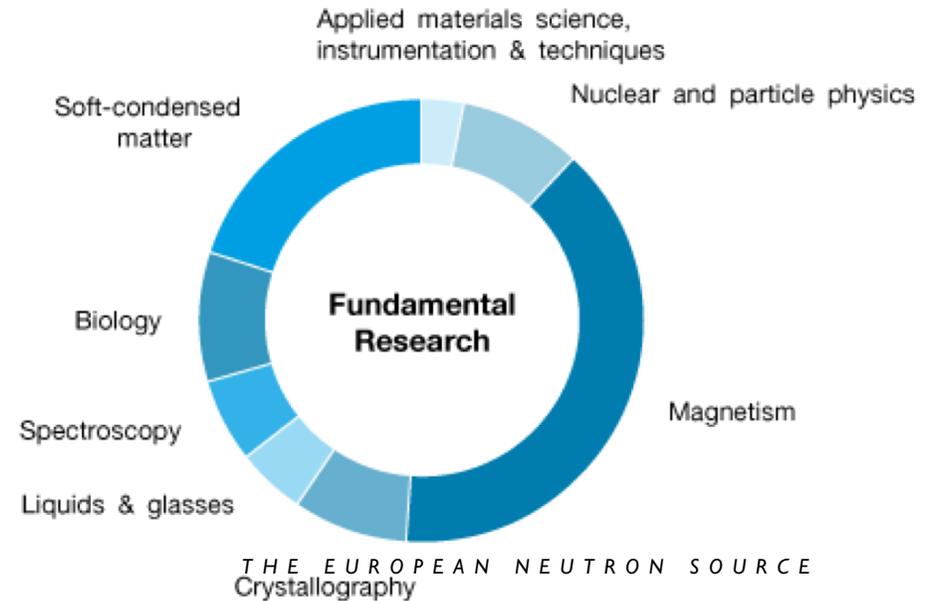

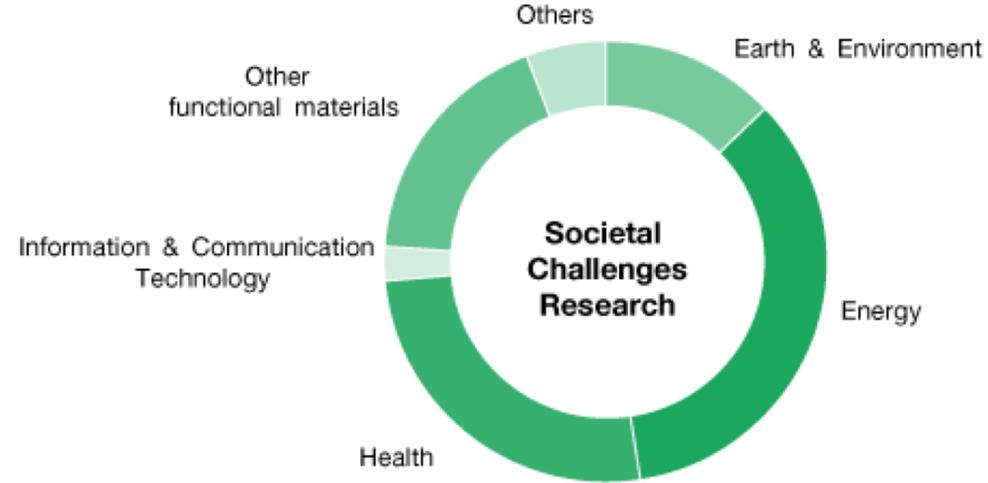

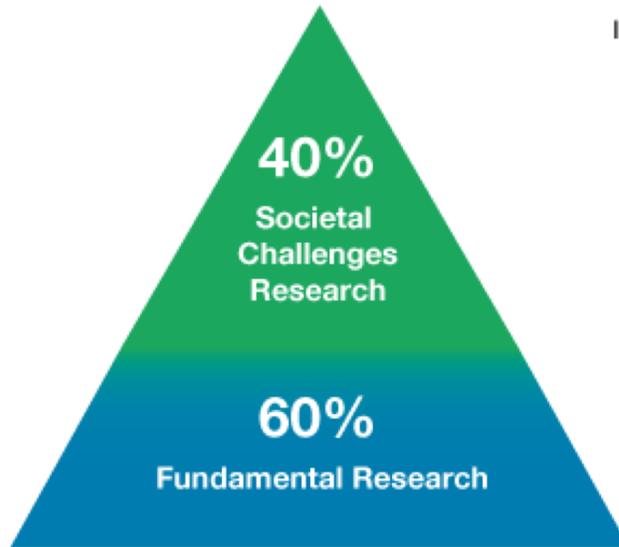

4 cycles of 50 days/year

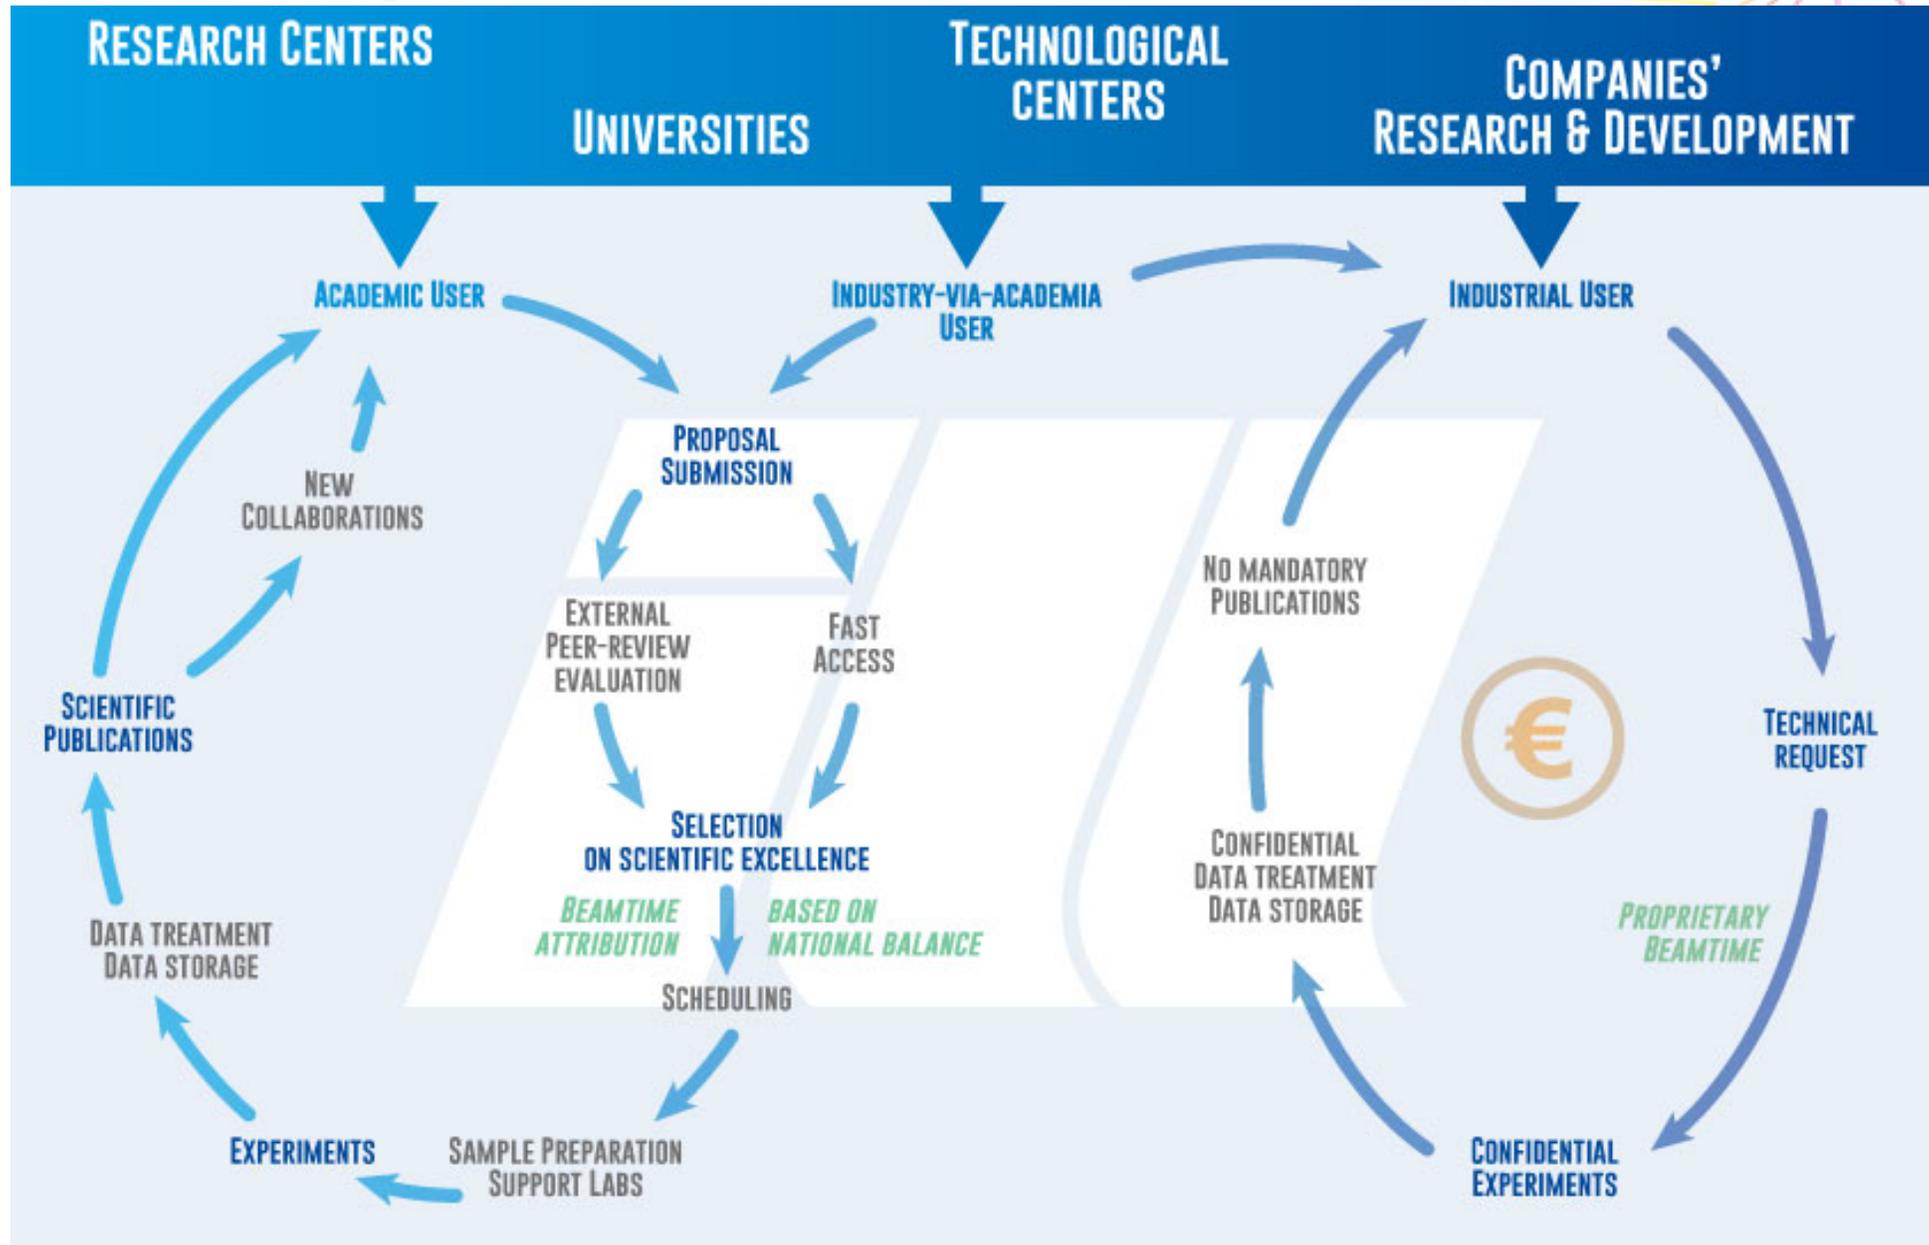

Research Areas

As per accepted proposals

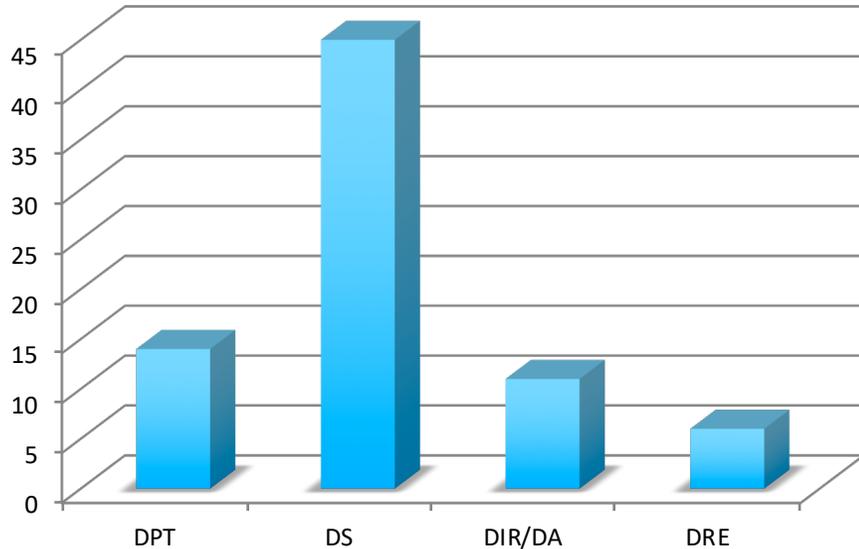

THE EUROPEAN NEUTRON SOURCE
Crystallography

How to Request Beam Time

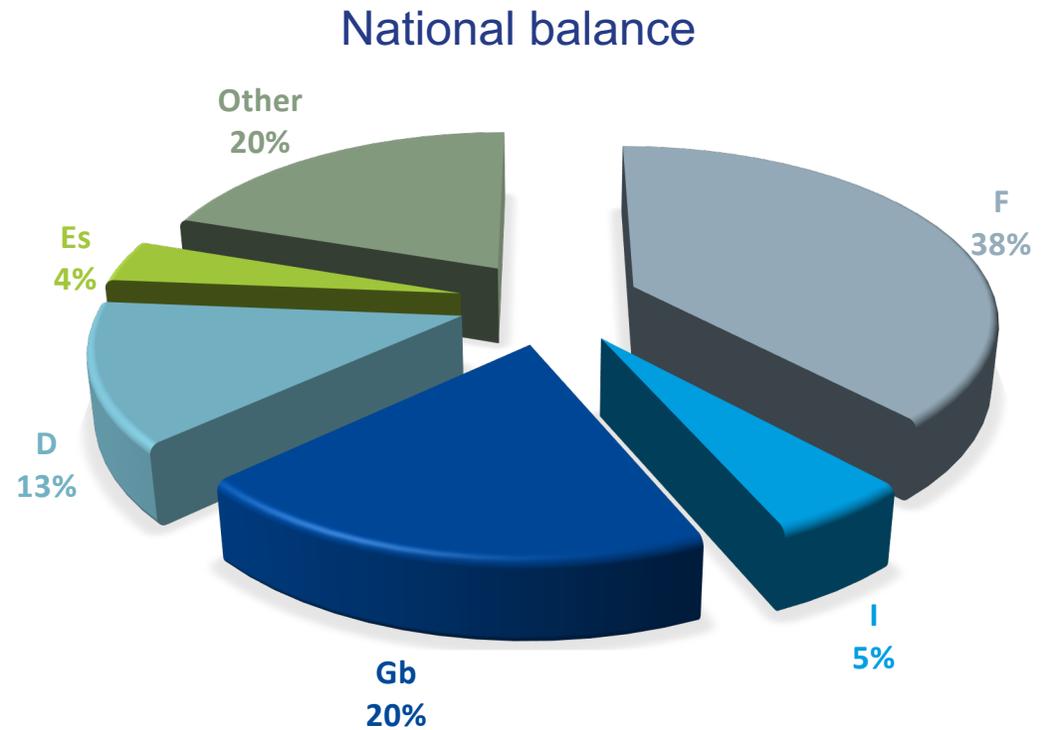

Students @ ILL

- 180 month of traineeship from ILL dedicated budget allocated each year
- Specific external founding
 - Erasmus
 - STFC
 - EU projects

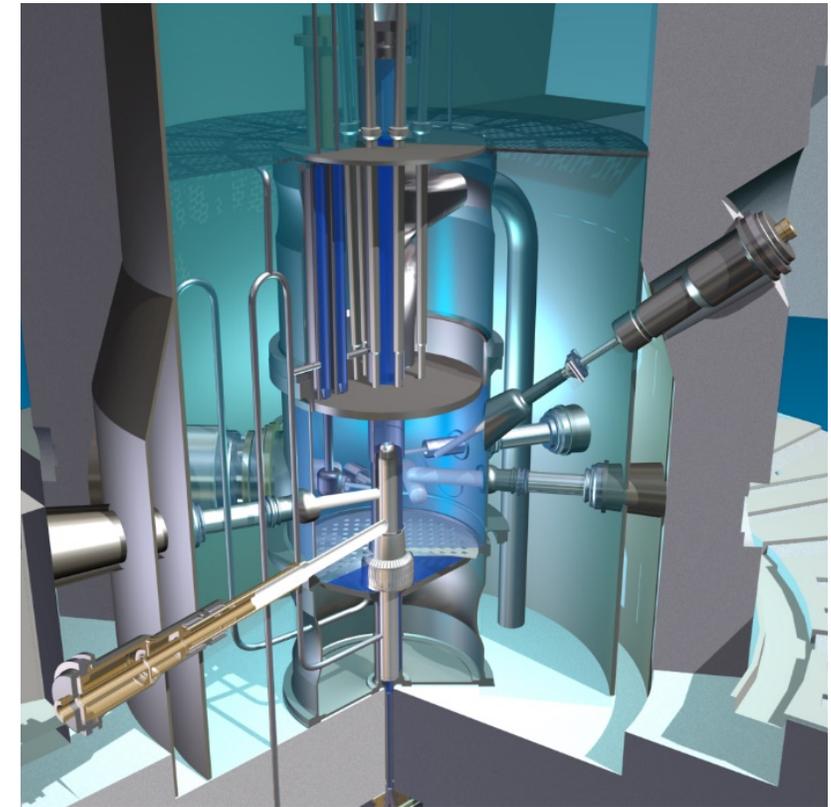

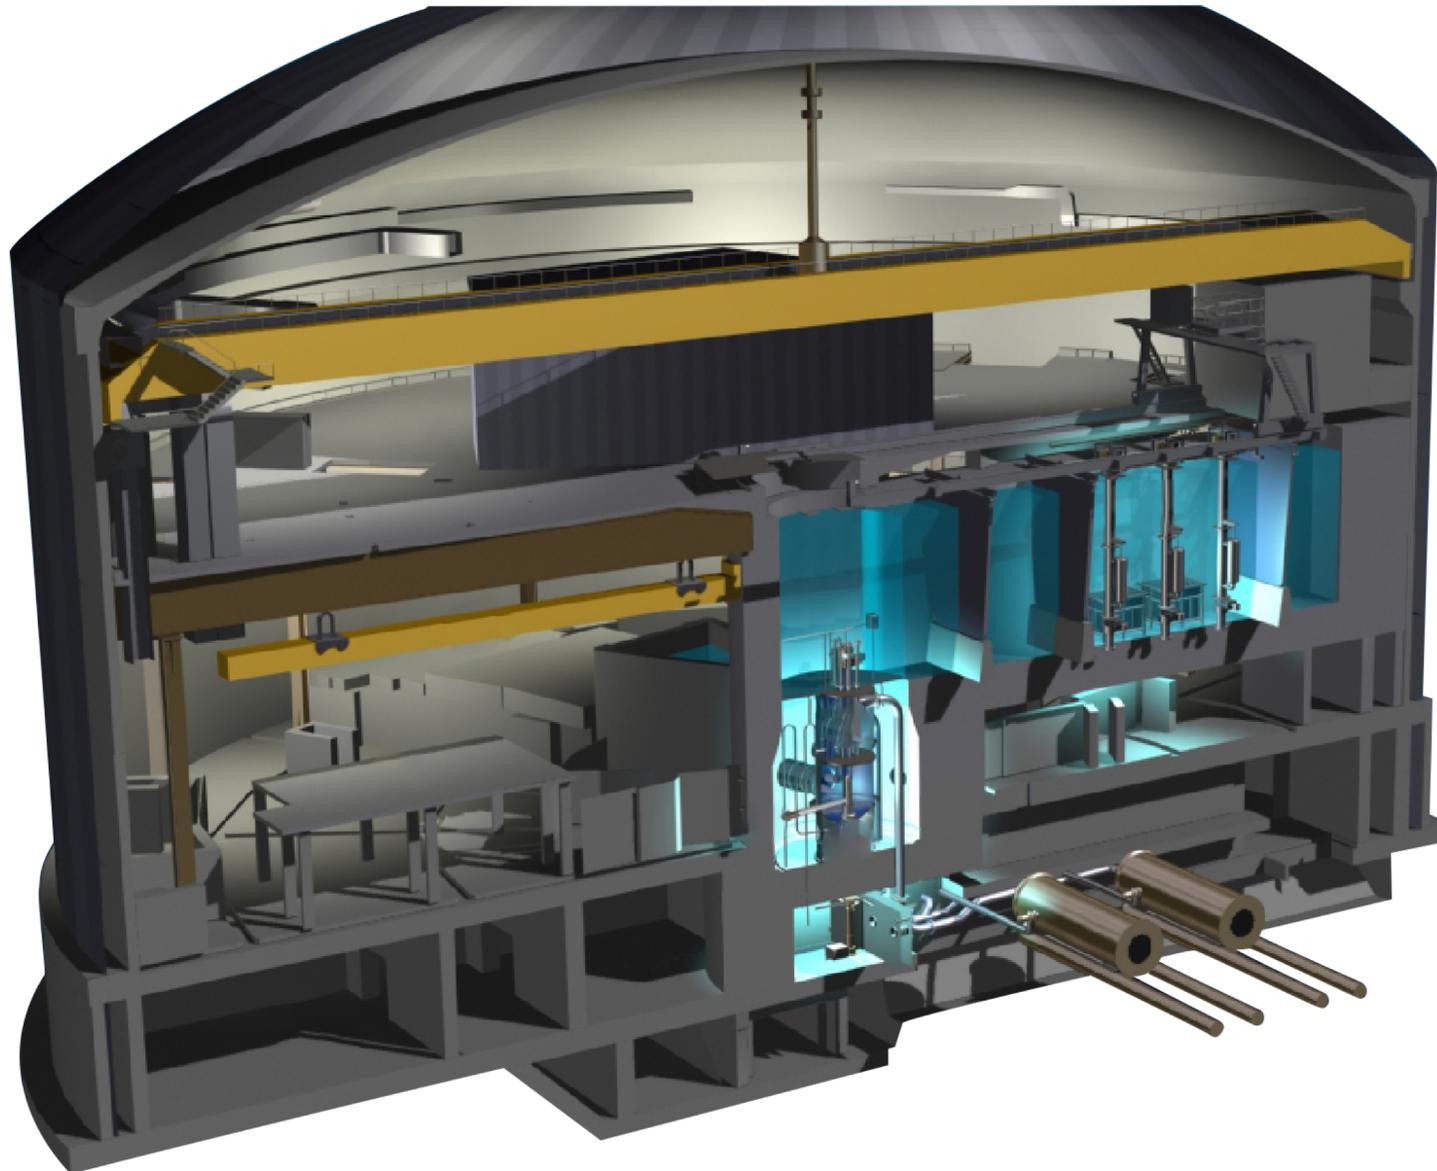

Students distribution per division

Average of about 10 new PhD students/year

The ILL Reactor

**A neutron source generating
 5×10^{18} fast neutrons/sec
at a max power of 58 MW**

The ILL Reactor

INSTITUT MAX VON LAUE - PAUL LANGEVIN

Neutron Production

Fission Reaction

Thermal

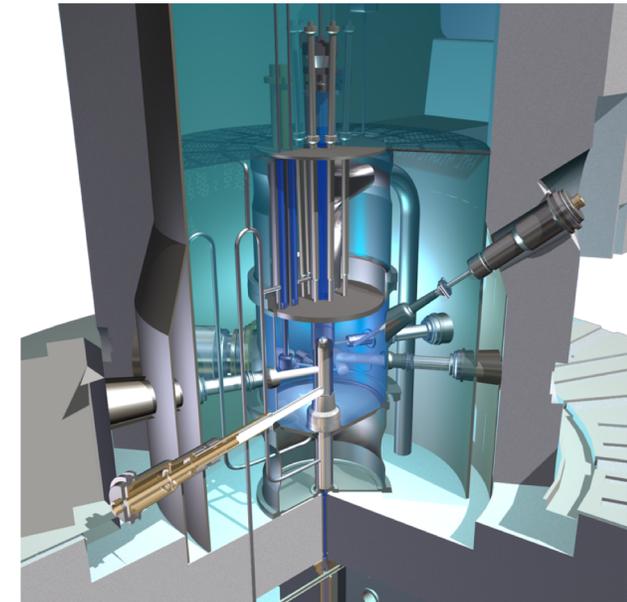

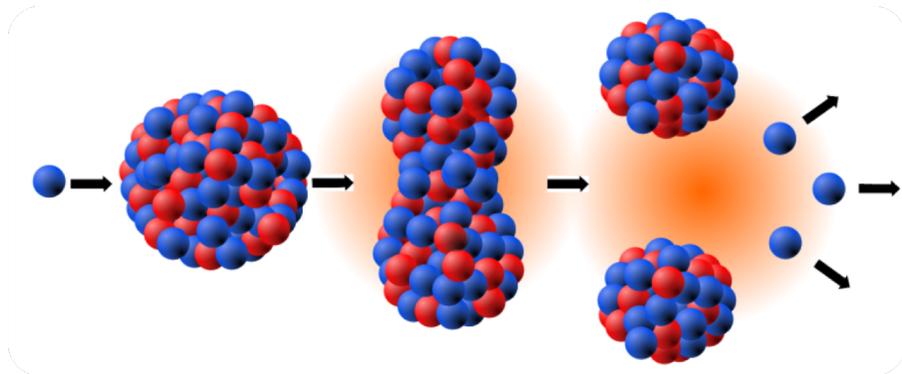

1 neutron to maintain chain reaction

1 neutron escapes & is available for use

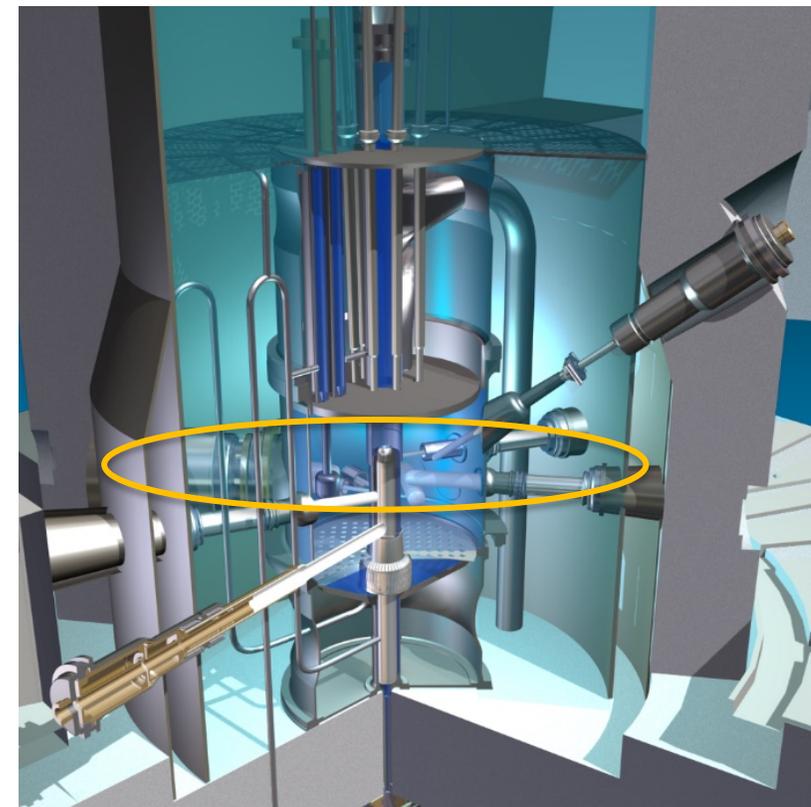

0.5 neutrons absorbed

2 to 3 neutrons

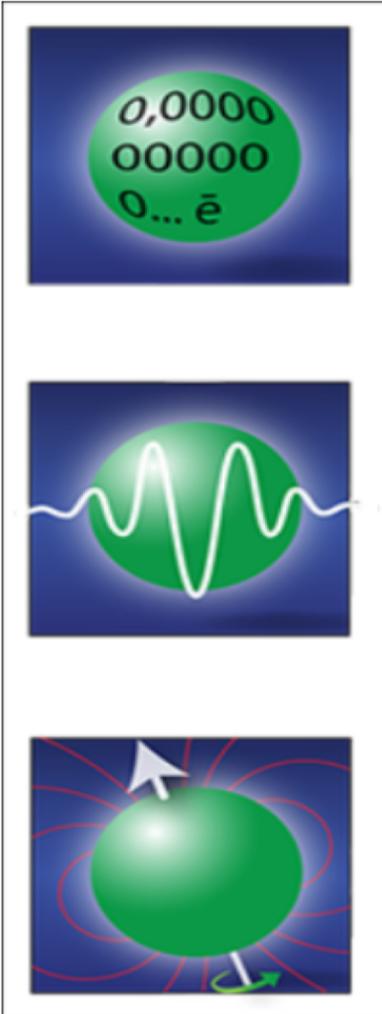

$$\text{No. of fissions/sec} = \frac{20 \times 10^6 \text{ watts}}{200 \text{ MeV/fission}}$$

How Neutrons Are Extracted

Neutrons: A Powerful Probe

No electric charge

It therefore has an excellent penetration depth for most materials.

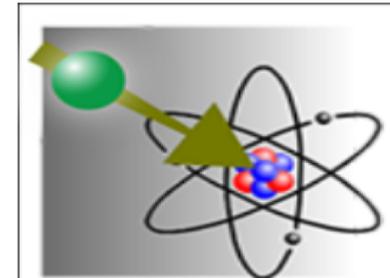

Associated wave

Neutron beams can be reflected, refracted, diffracted, just like any other wave.

Spin + associated magnetic moment

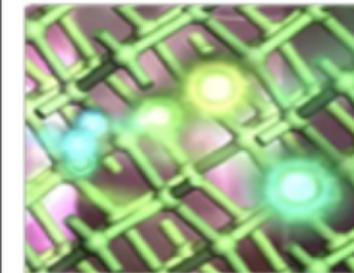

It therefore behaves like a tiny compass needle able to probe magnetism at the atomic scale.

Interacts with the nucleus of atoms
Whereas X-rays and electrons interact with the electron cloud.

Energy range

It is similar to the energy of atomic and molecular motions in matter, making the neutron very sensitive to these motions.

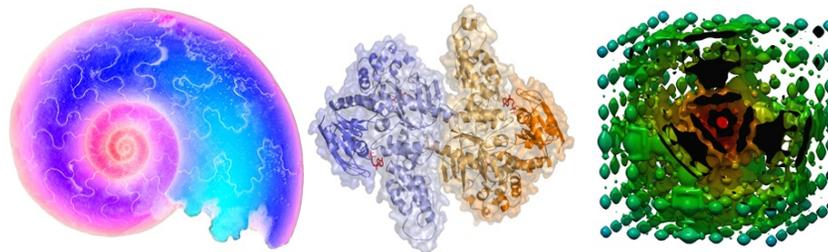

Neutrons: A Powerful Probe

The properties of matter and materials are largely determined by their structure and dynamics at the atomic scale - *distance between atoms* $\sim 1 \text{ \AA} = 1/100\,000\,000 \text{ cm}$

The wavelength of the neutron is comparable to atomic sizes and the dimensions of atomic structures, which explains why neutrons can « see » atoms.

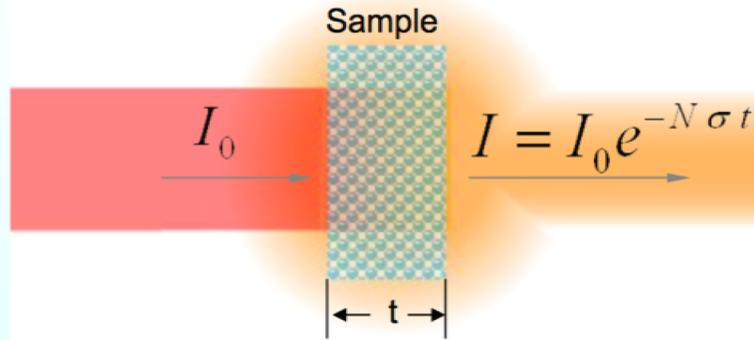

Therefore neutrons are an ideal tool to understand the world around us, telling scientists:

Where is which atom?
How does it bind?
How does it move?
What surrounds it?

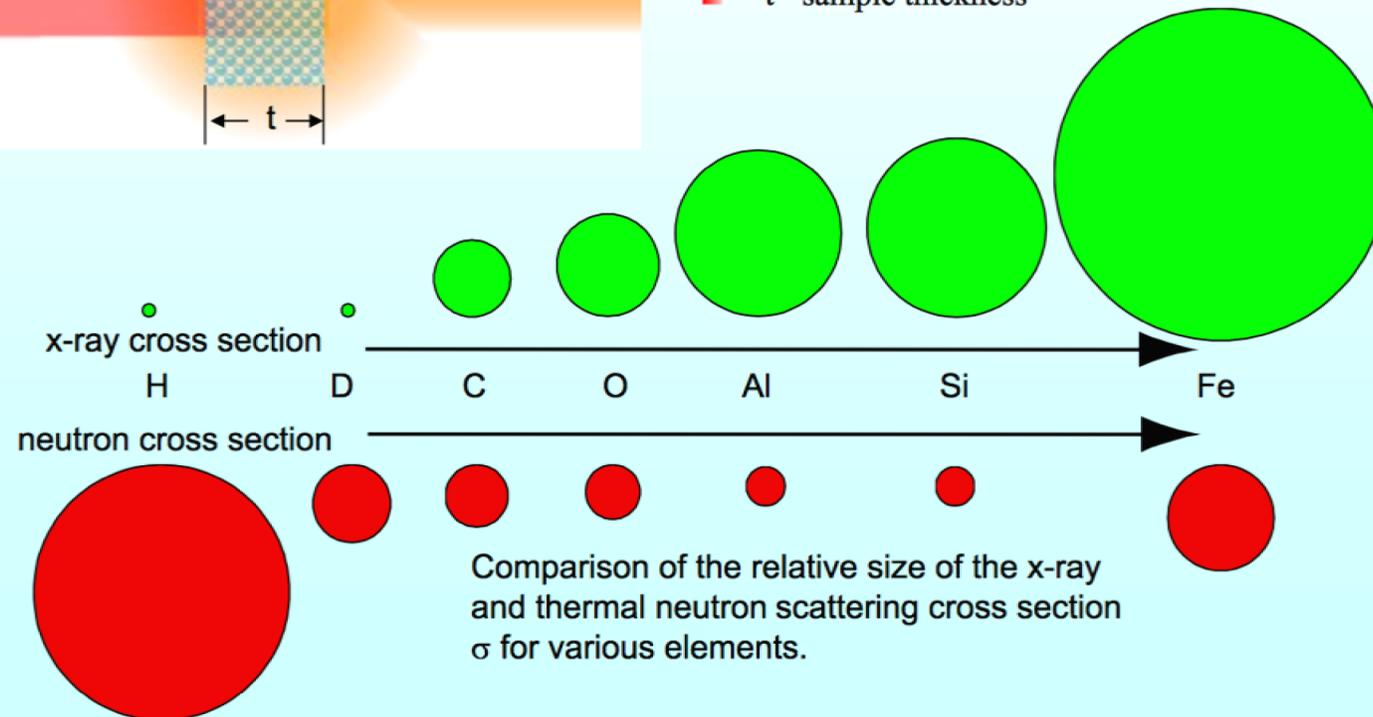

Neutrons: A Powerful Probe

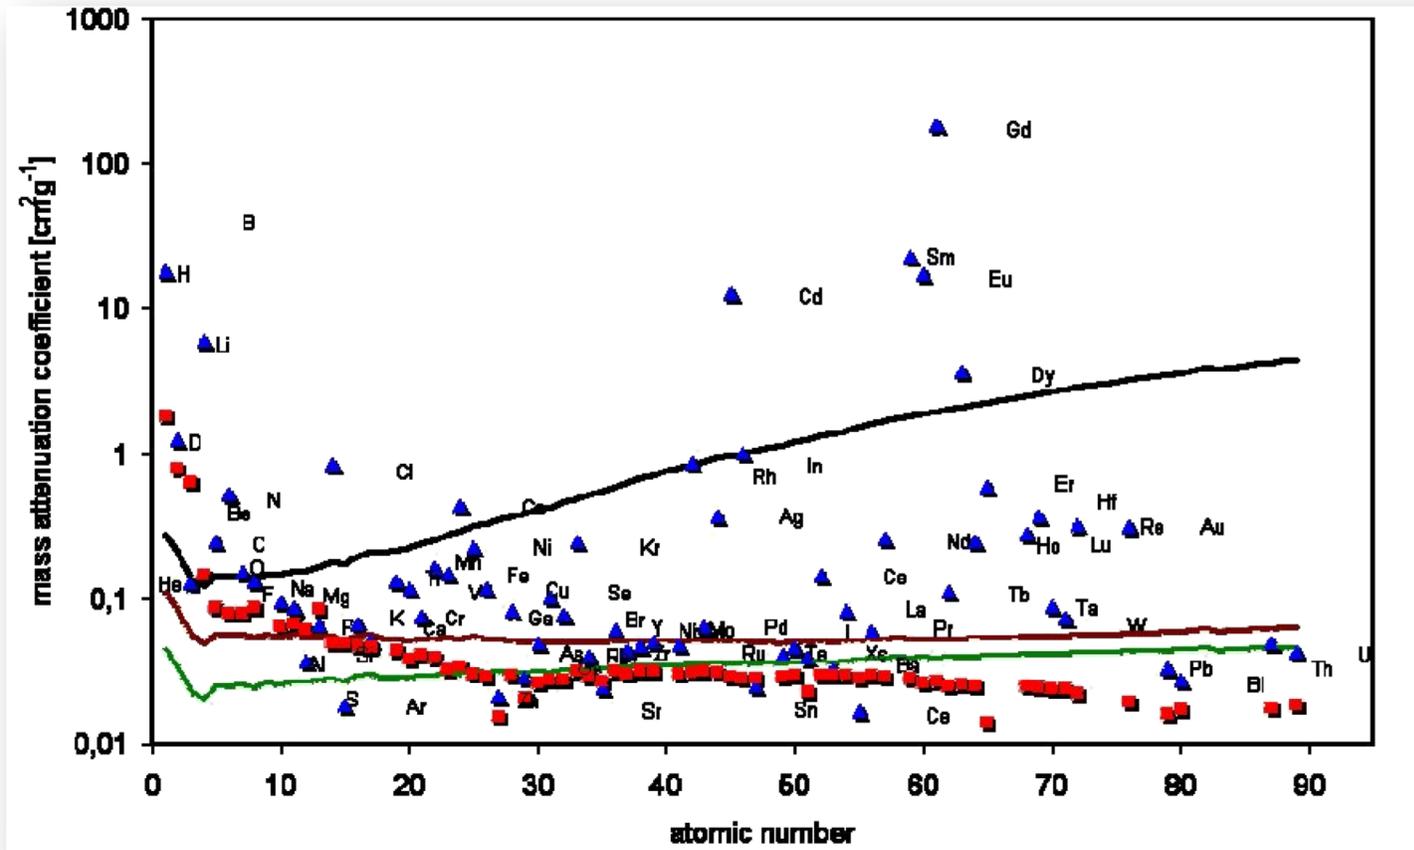

Sensitivity, Penetration, and Dynamic Range

- N - numerical density of sample atoms per cm^3
- I_0 - incident neutrons per second per cm^2
- σ - neutron cross section in $\sim 10^{-24} \text{ cm}^2$
- t - sample thickness

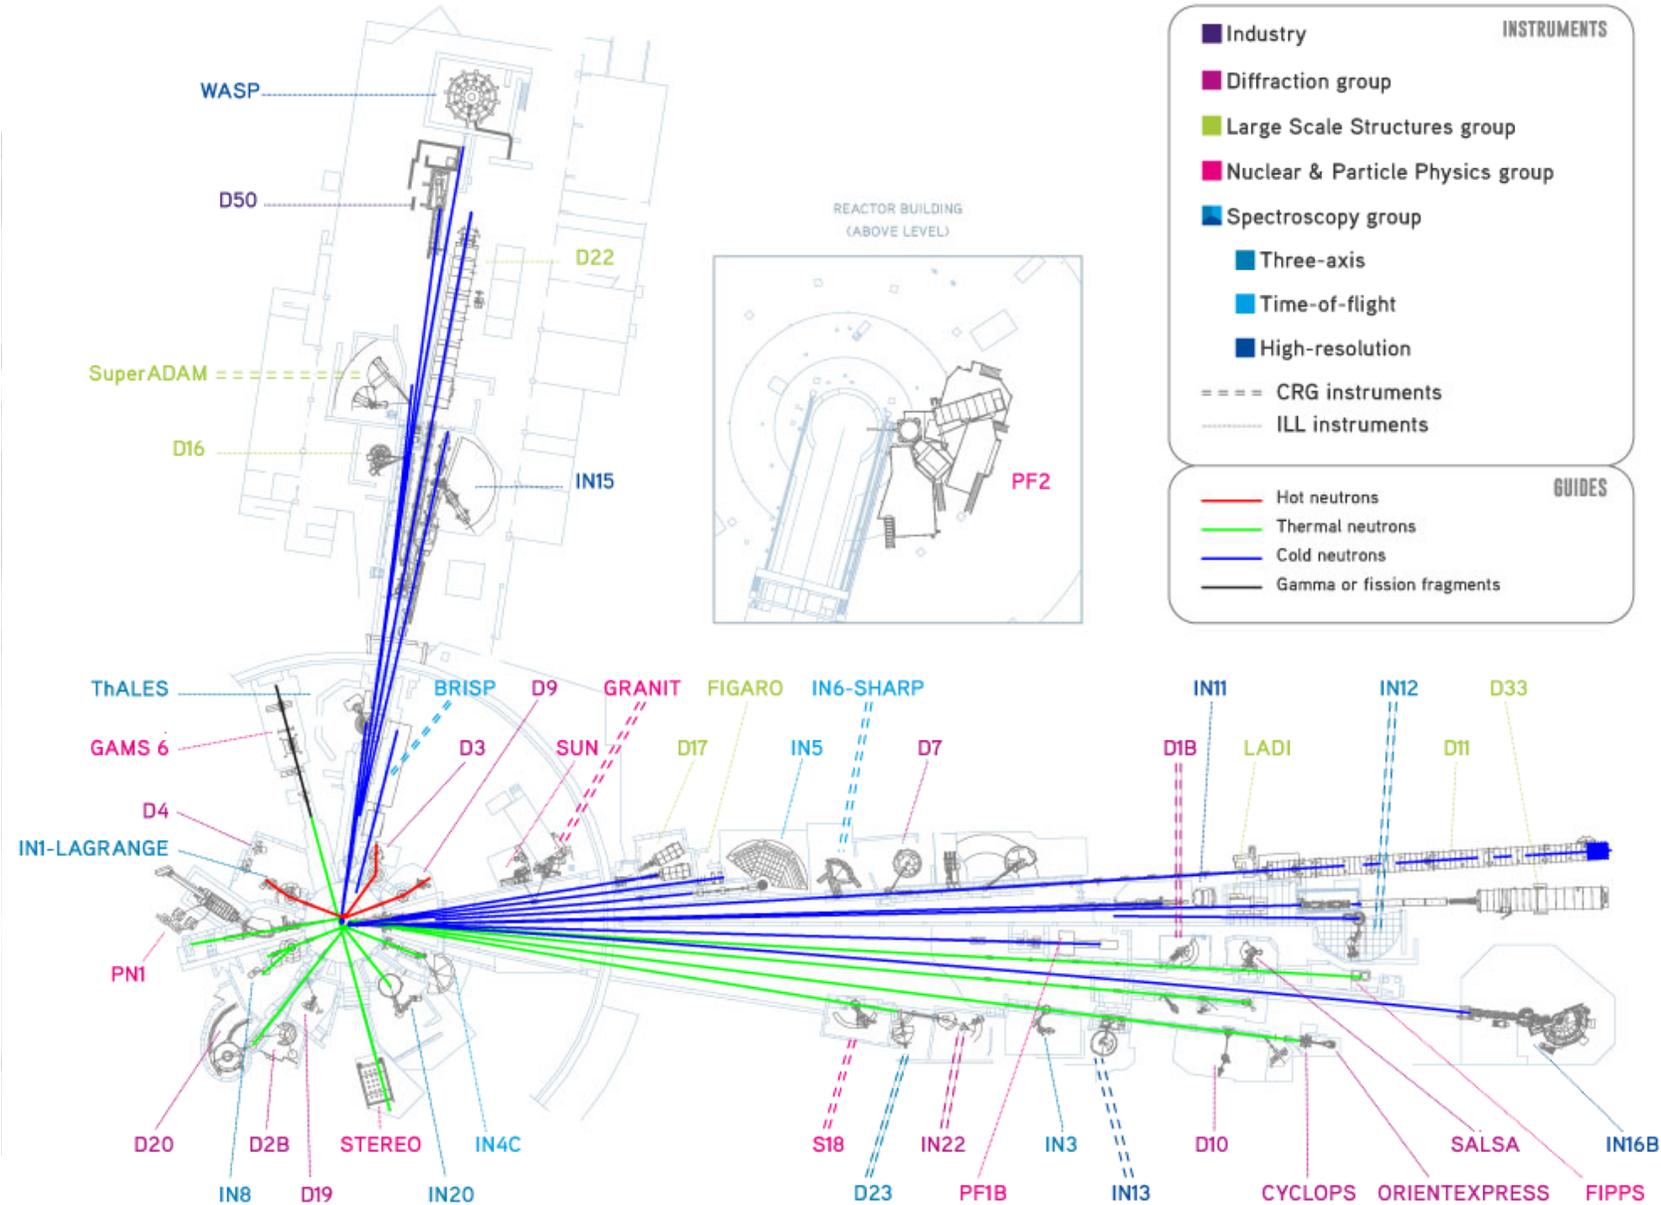

Neutrons: A Powerful Probe

Attenuation coefficient

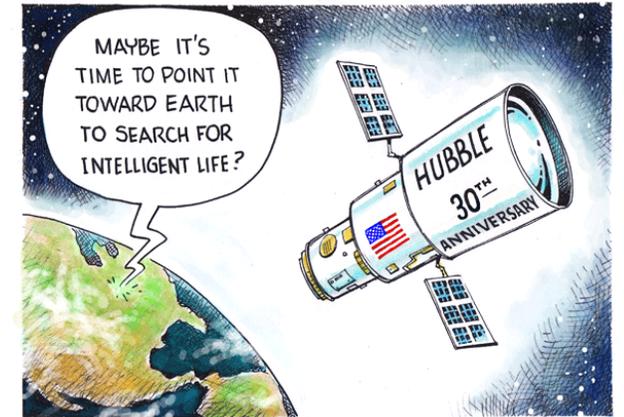

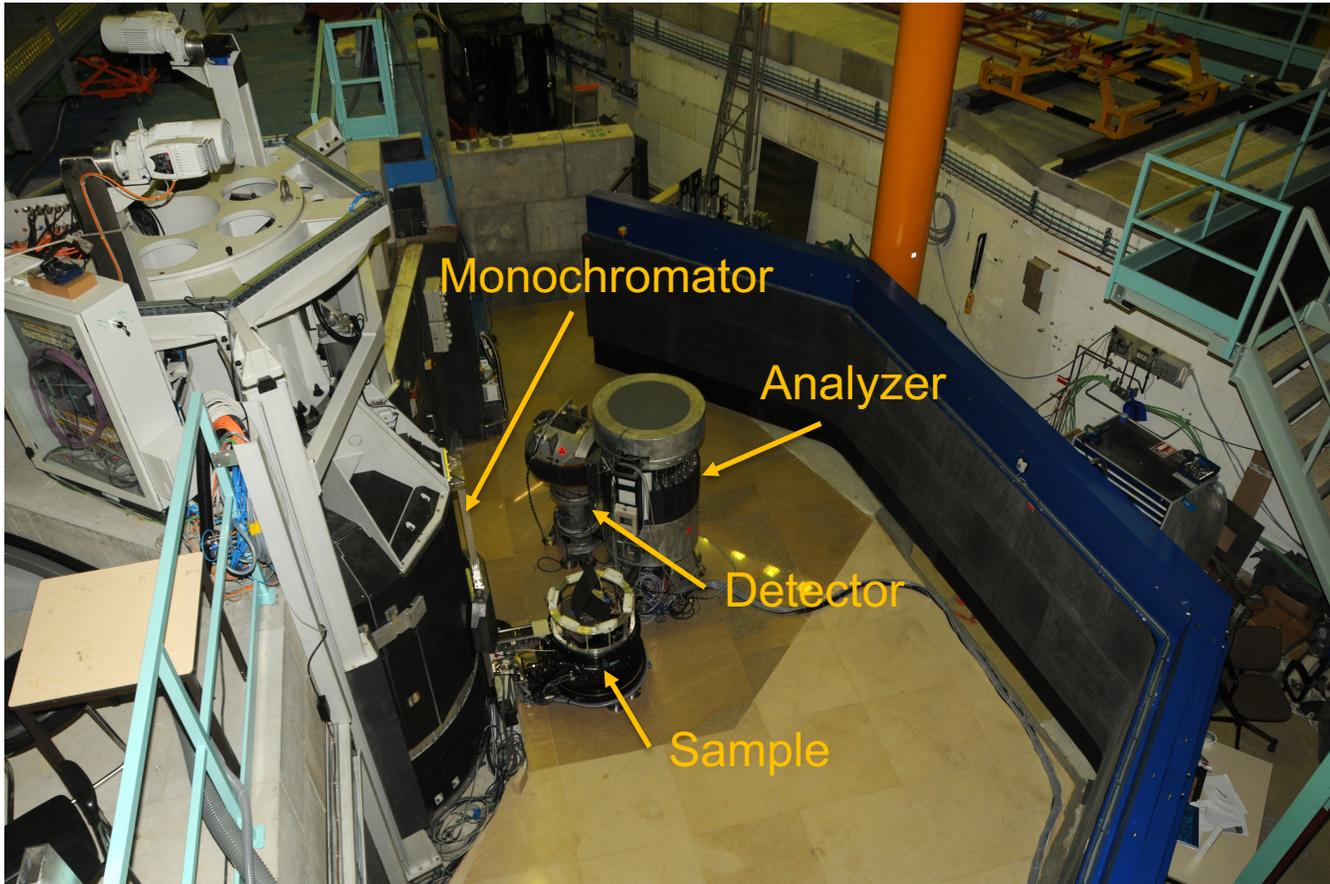

- 120 keV X-ray
- 1,25 MeV Gamma-ray
- 8 MeV Gamma-ray
- ▲ 25 meV neutrons
- 1.7 MeV neutrons

The Instrument Suite

Autonomous Measurements on ThALES

ThALES: Three Axis Neutron Spectrometer

Incoming flux:
 10^7 to 10^9 n/cm²/s

Nr of analyzing channels:
Classical TAS: 1
FlatCone: 31

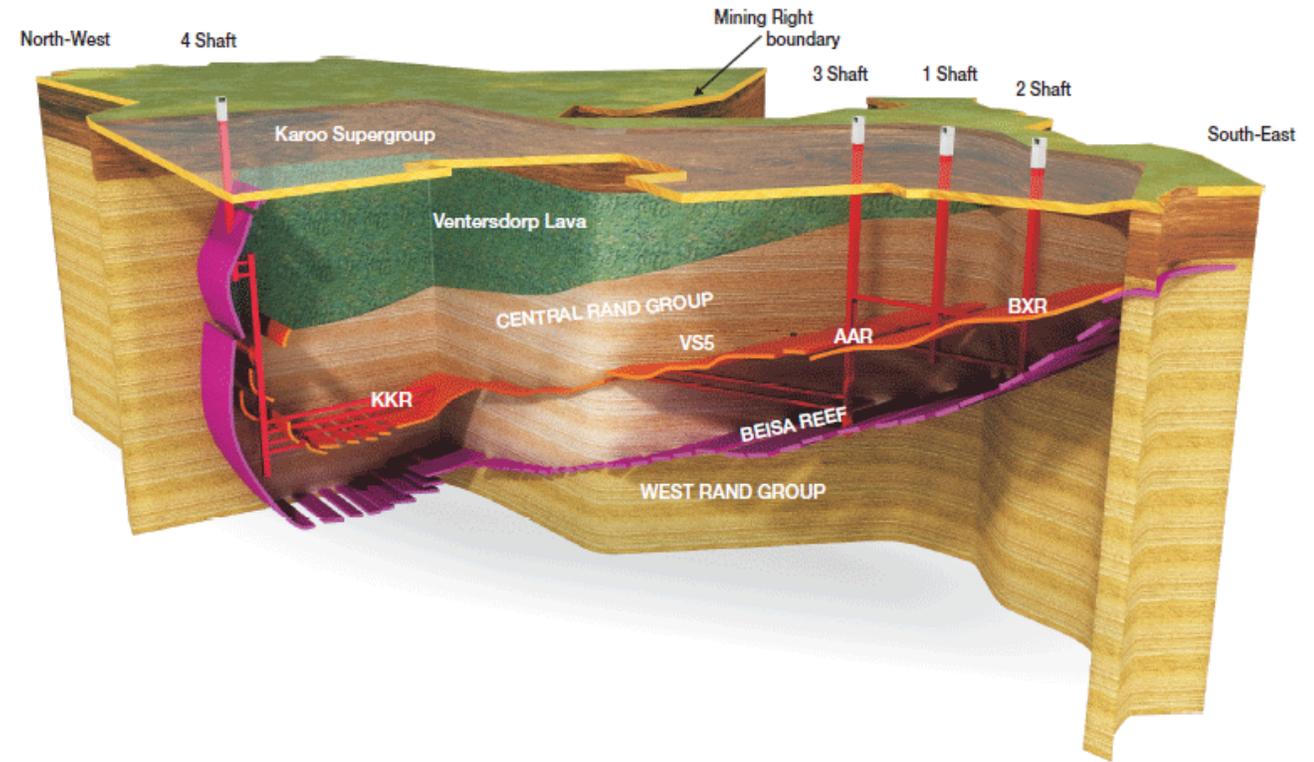

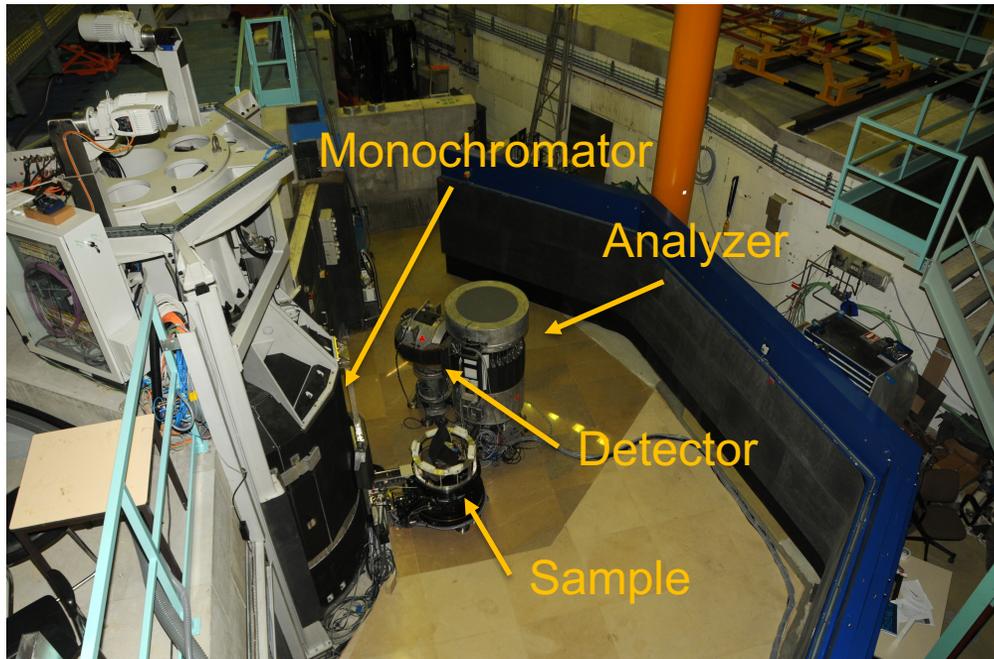

Efficiency depends on **interactivity**

gpCAM - Autonomous Measurements

Inspired by the Kriging regression model

ThALES: three Axis Neutron Spectrometer

Danie G. Krige: distance-weighted average gold grades at the Witwatersrand reef (South Africa).

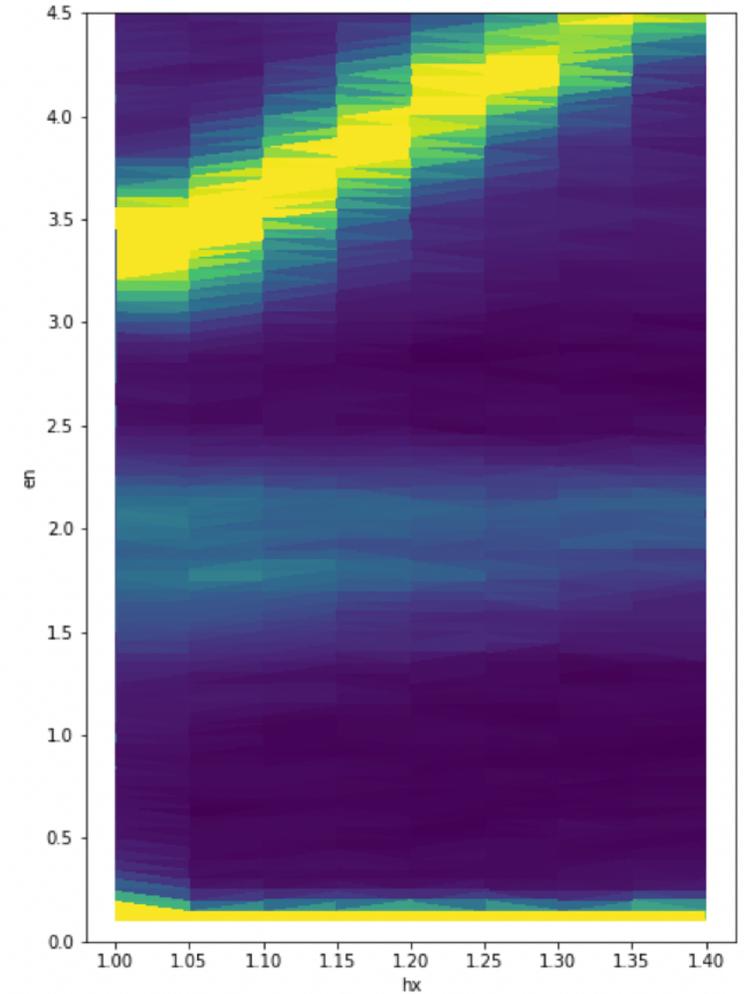

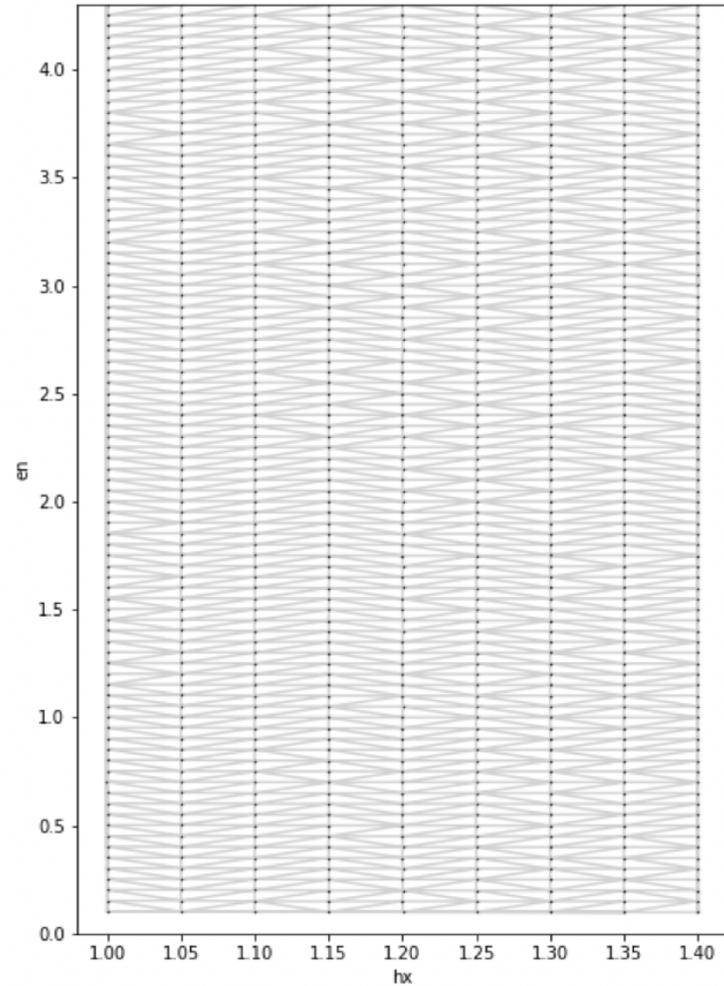

Georges Matheron: mathematical/ theoretical basis 1960

Grid Measurement

Step in $hx = 0.05 \text{ \AA}^{-1}$

Step in $EN = 0.05 \text{ meV}$

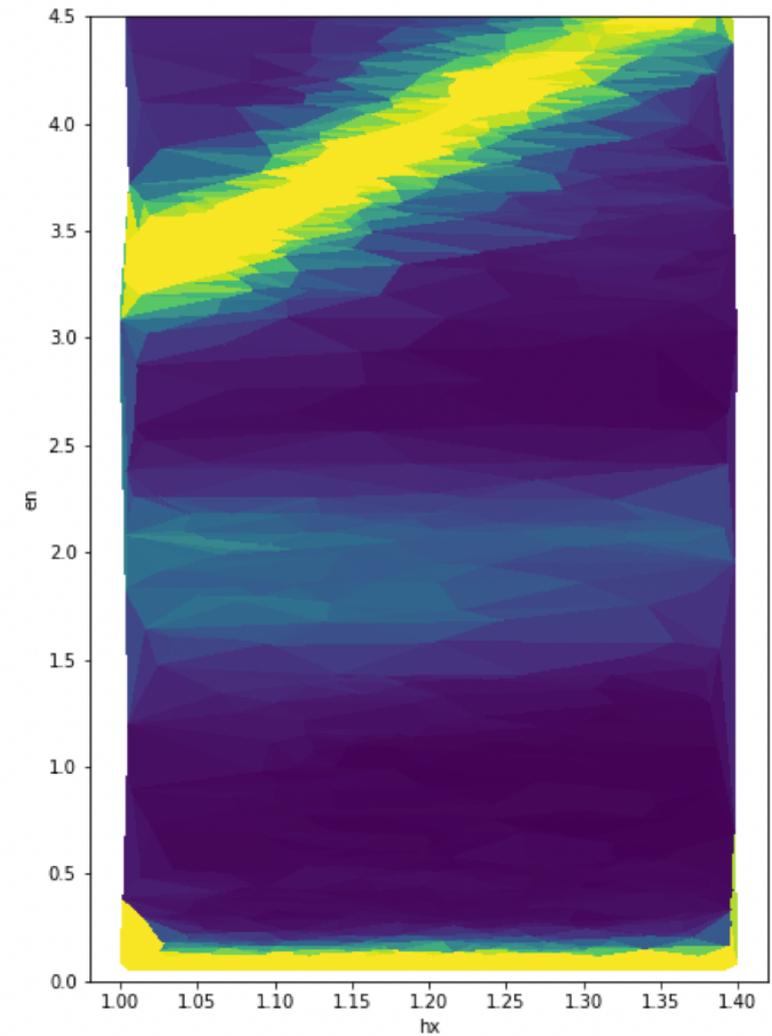

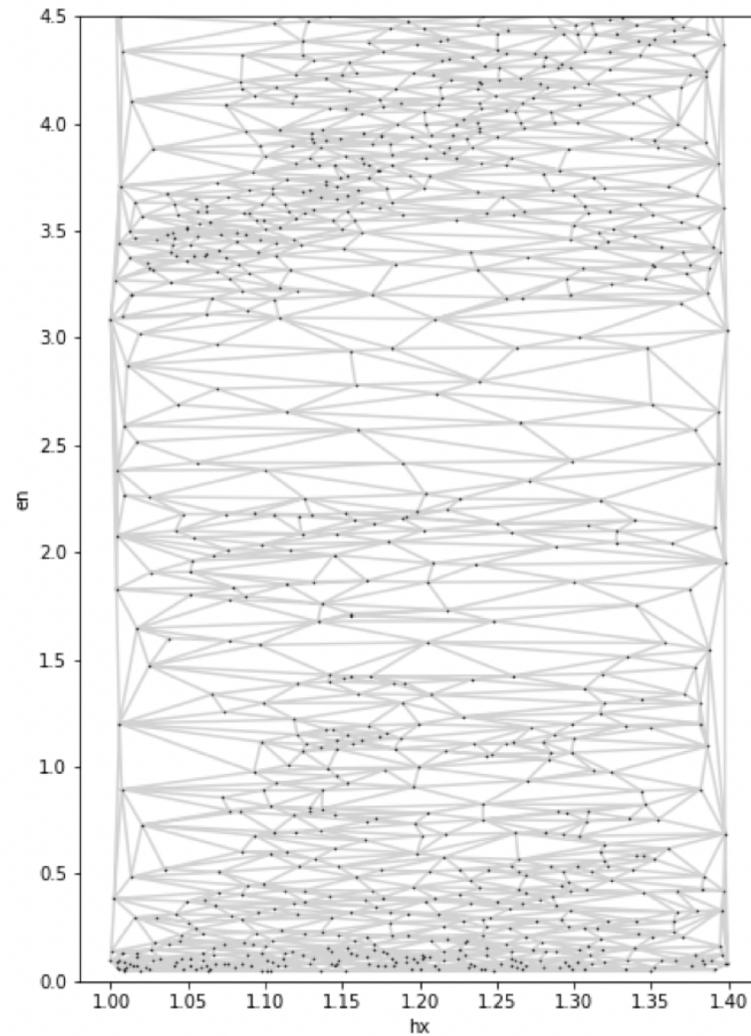

Number of points: 801

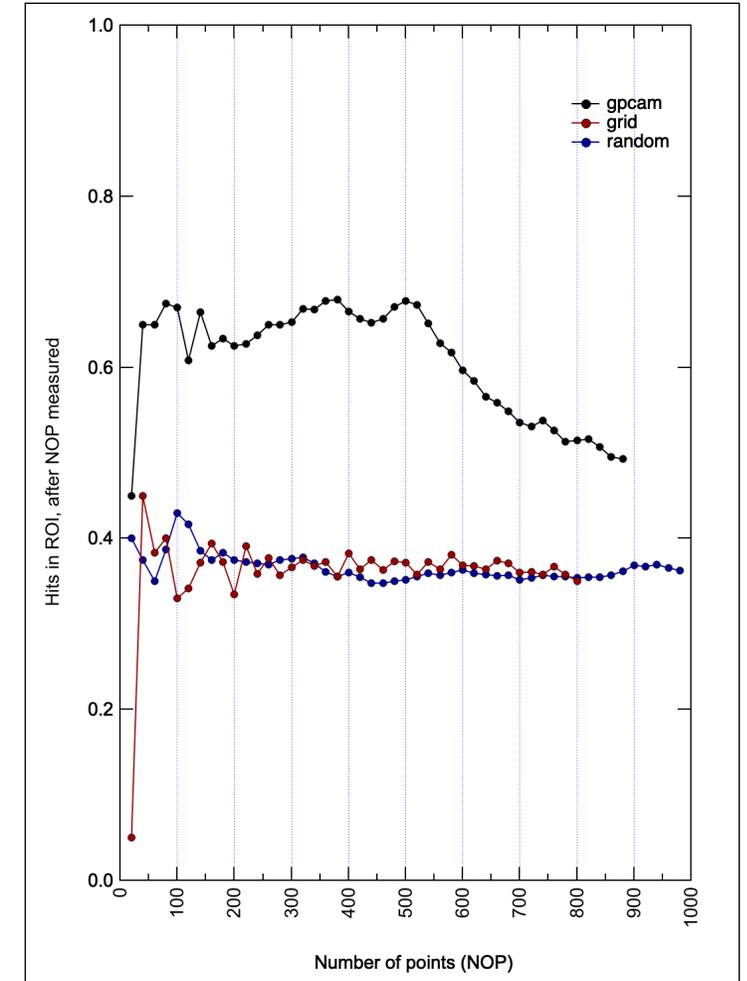

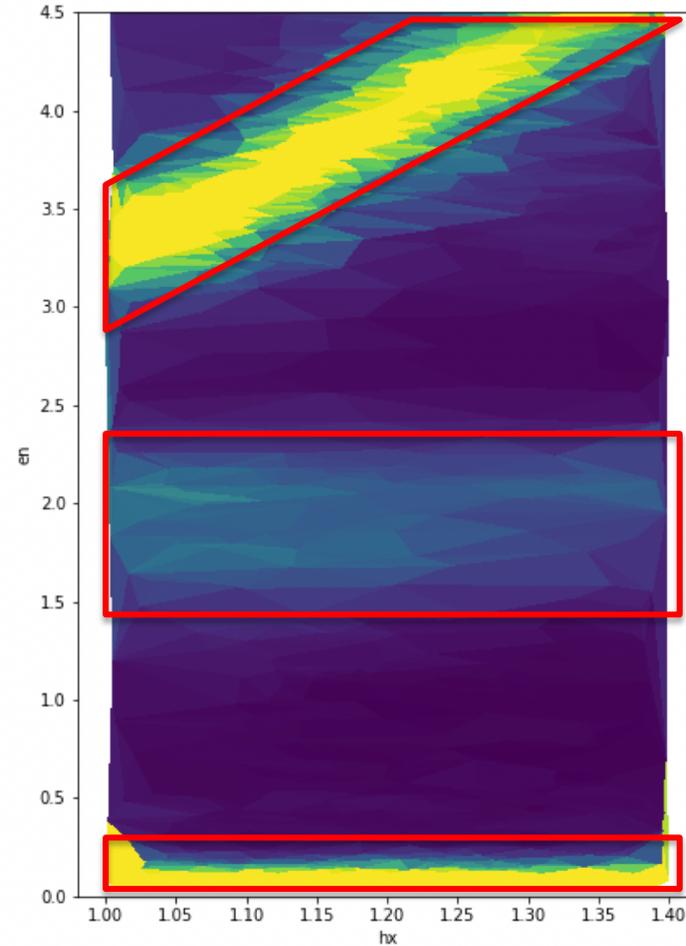

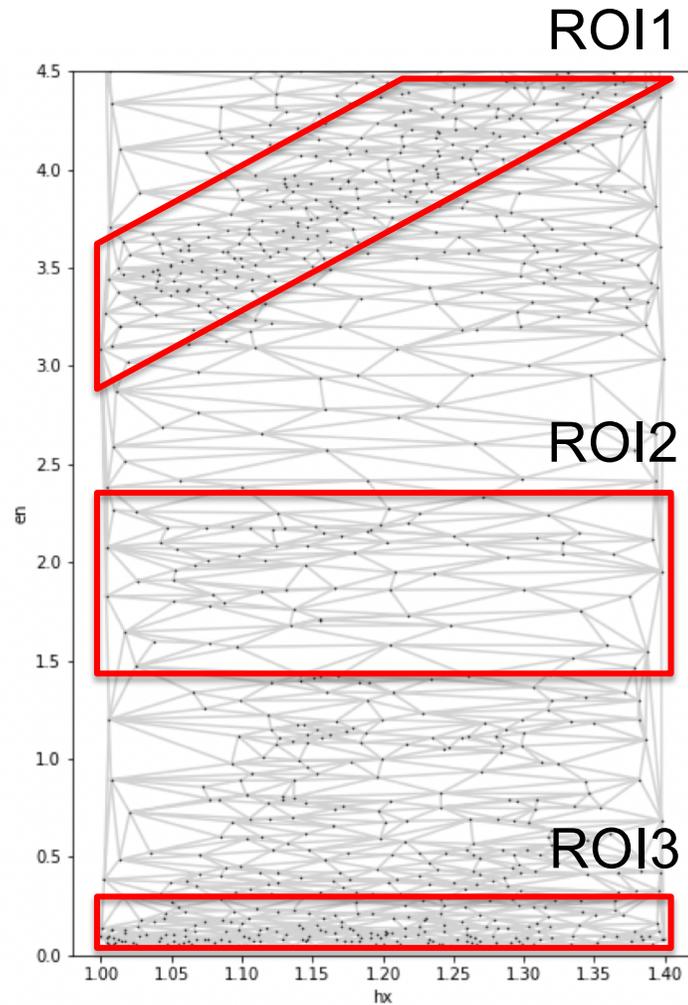

Measuring magnetic excitations along $[110]$

gpCAM Driven Measurement

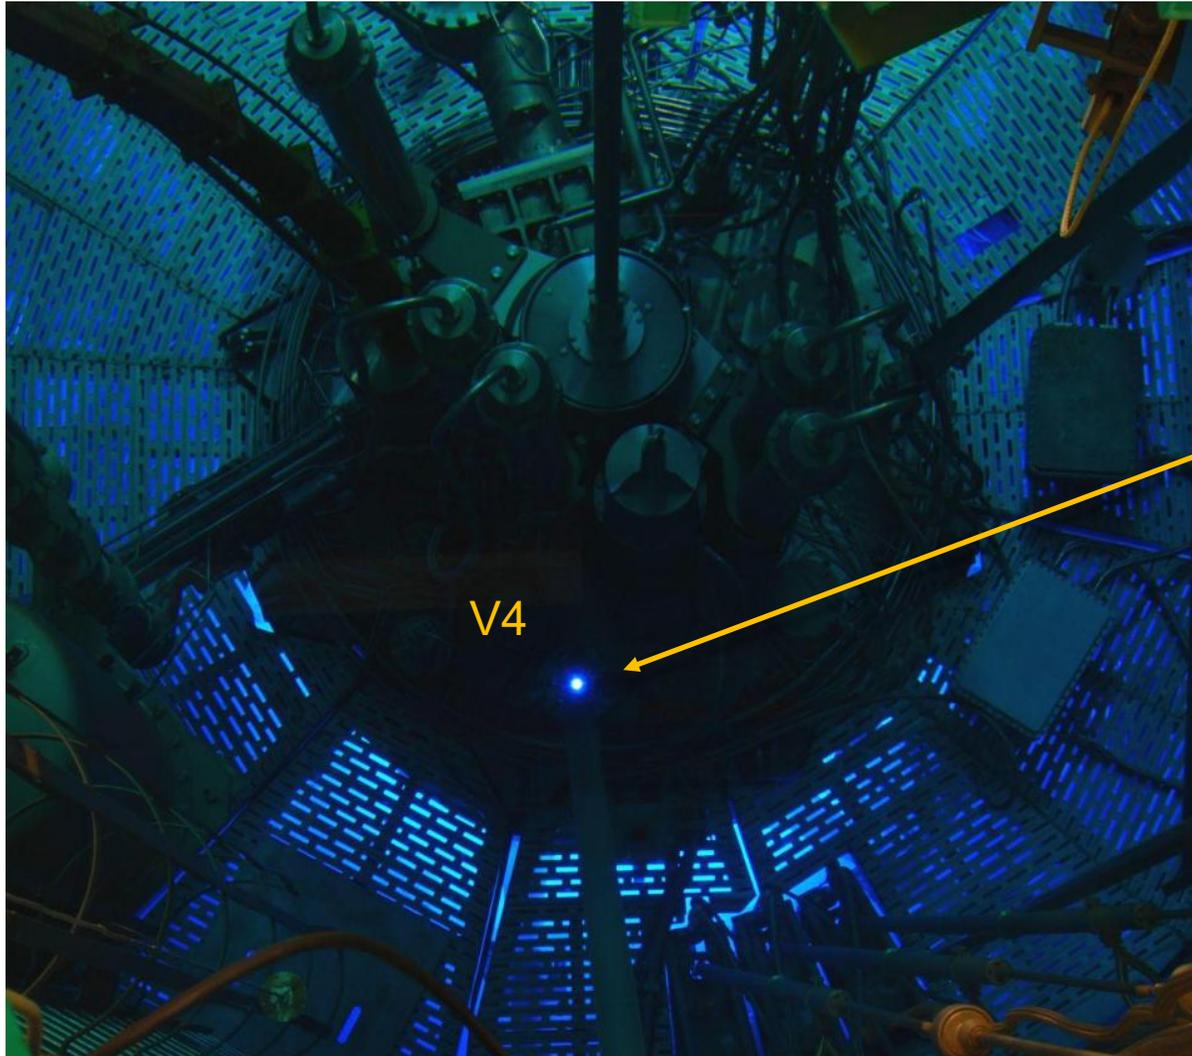

Number of points: 899

Hits Within Region Of Interest

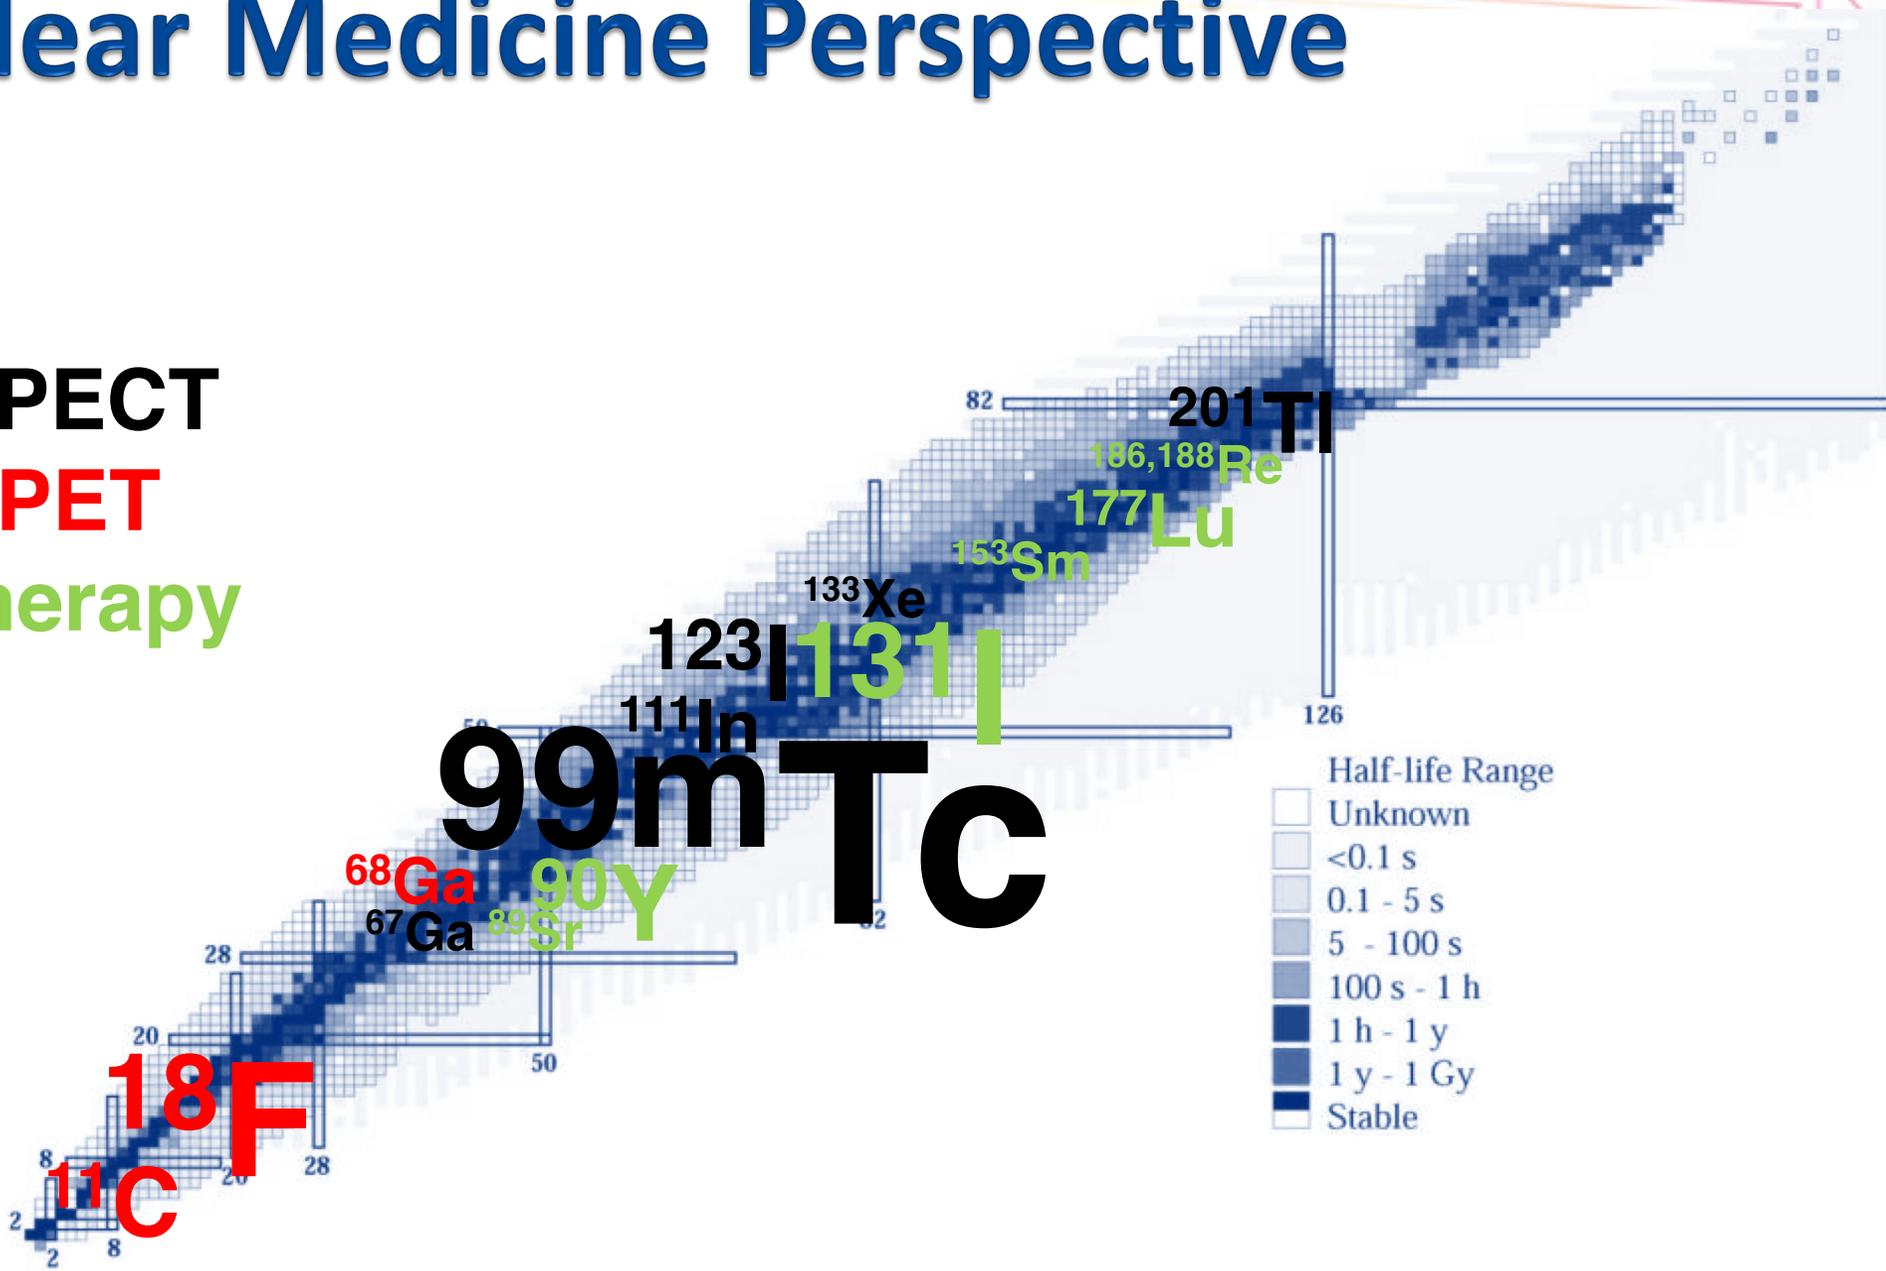

Radio Isotope “Made in Grenoble”

The highest neutron flux in Western Europe
 $1.5 \cdot 10^{15} \text{ n cm}^{-2} \text{ s}^{-1}$

H₂ Storage in Fuel Cells

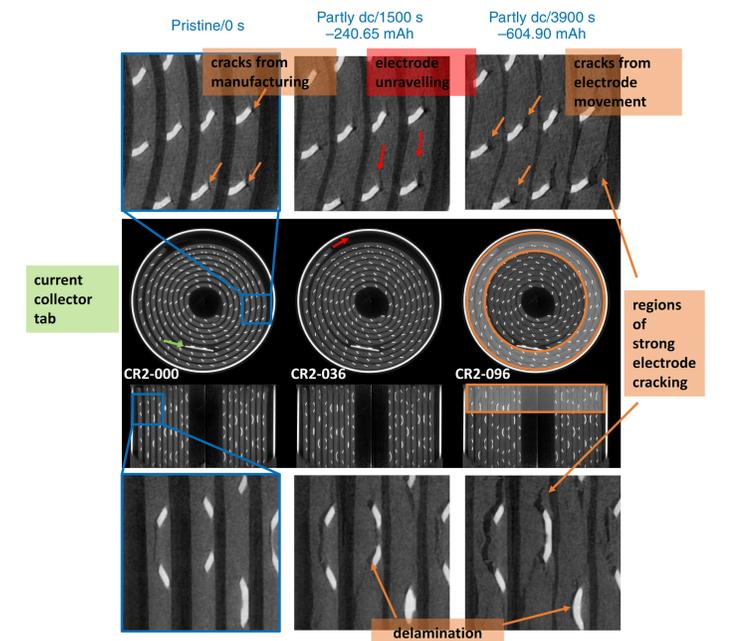

H₂ flow through a membrane

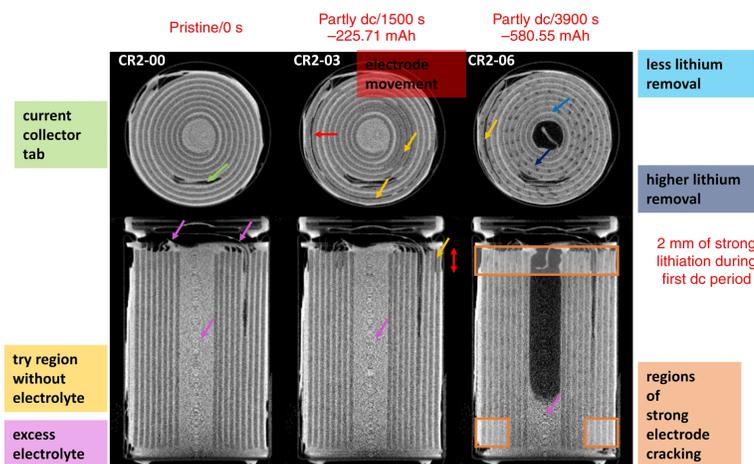

Dynamic water formation in a H₂ fuel cell

Understanding Ageing of Li Batteries

X-ray tomography

In total, 103 tomograms were recorded labelled from CR2-000 to CR2-102. One tomogram was recorded every 40 s with a total acquisition period of 2.8 s. Here the pristine state and two partly discharged states are presented. The images show the cracking and volume expansion of the MnO_2 electrode during cell discharging. The highly absorbing steel casing is visible as very bright ring around the wounded membrane–electrode ensemble

Neutron tomography

Captured during the discharge over a 4.7Ω resistor, where the lithium electrode and the excess of electrolyte in the middle of the cell are clearly visible. Lithium intercalation and electrolyte consumption are observed, as well as electrode cracking and electrolyte consumption. In total, eight neutron tomograms were collected with an acquisition period of about 8 h.

Biology: Extreme Conditions

Halomonas is a microorganism destroying the wreck of the Titanic

It survives at a depth of ~3800 m

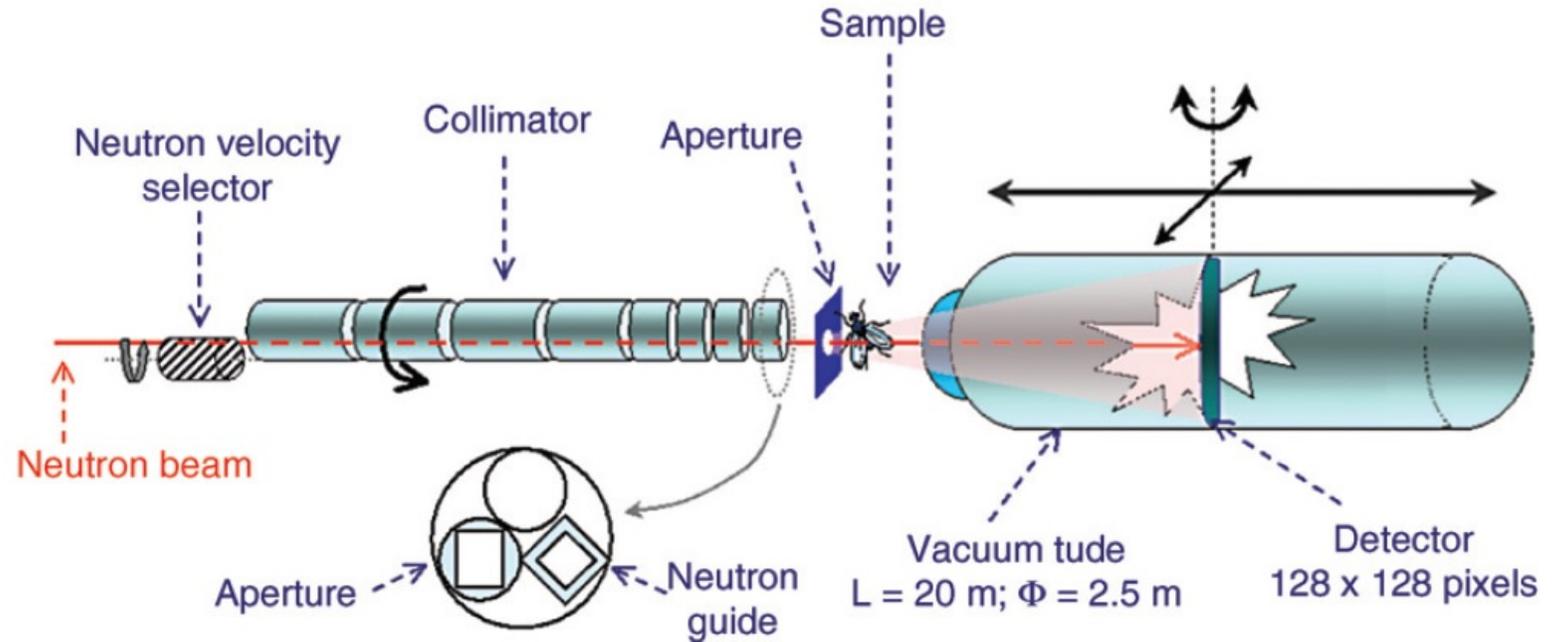

Neutron scattering experiments were designed in order to understand how ectoine permits Halomonas to survive in their extreme environment.

Understanding microbe adaptation to extreme environments remains a challenge of high biotechnological potential—in bioremediation and waste management.

Small Angle Neutron Scattering

The Swiss knife of material science: can deliver information on hard and soft matter, from crystals to biological structures

Neutrons Unlock The Secret of Limoncello

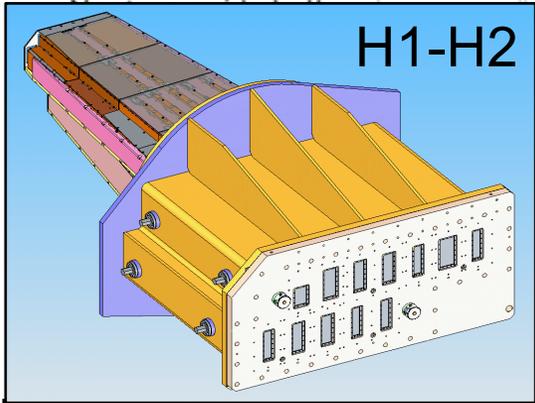

The key is the mix of alcohol, oil and water. Alcohol inhibits the repulsion of oil and water

Replacing the H of water and alcohol with D allows to increase contrast on the lemon oil component

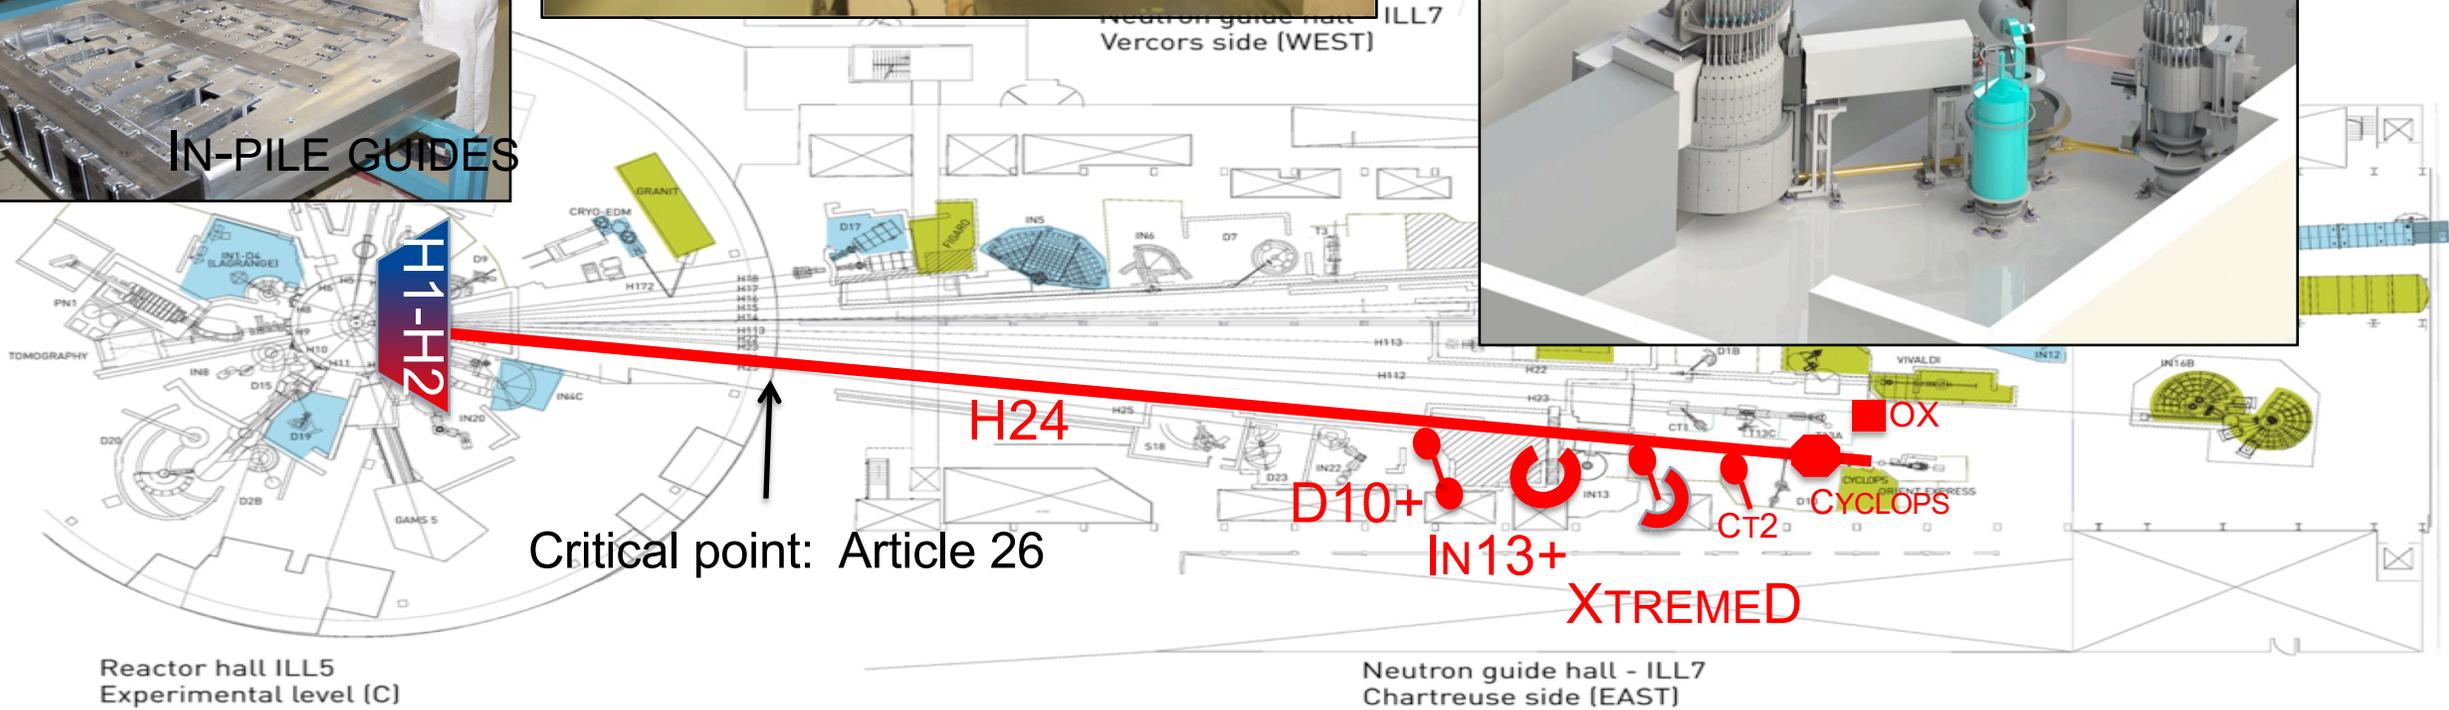

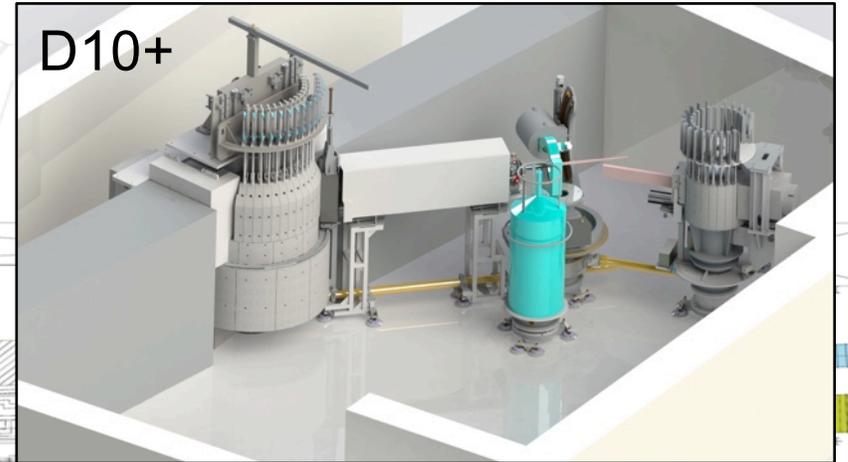

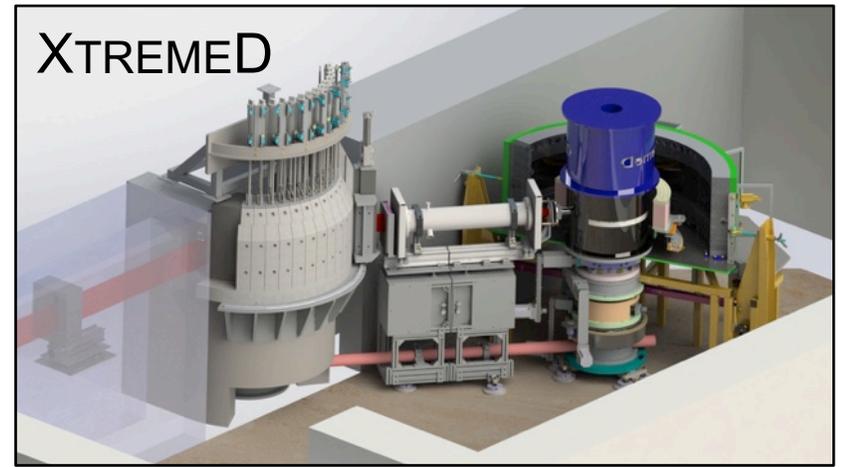

Neither sugar content nor temperature affects the appearance of limoncello at a microscope scale. However, varying the oil and water content did change how much oil was dissolved in the alcohol-water mix rather than locked up in droplets

Studying limoncello could help the growing industry in citrus oils for green solvents, environmentally-friendly plastics and insect repellent
