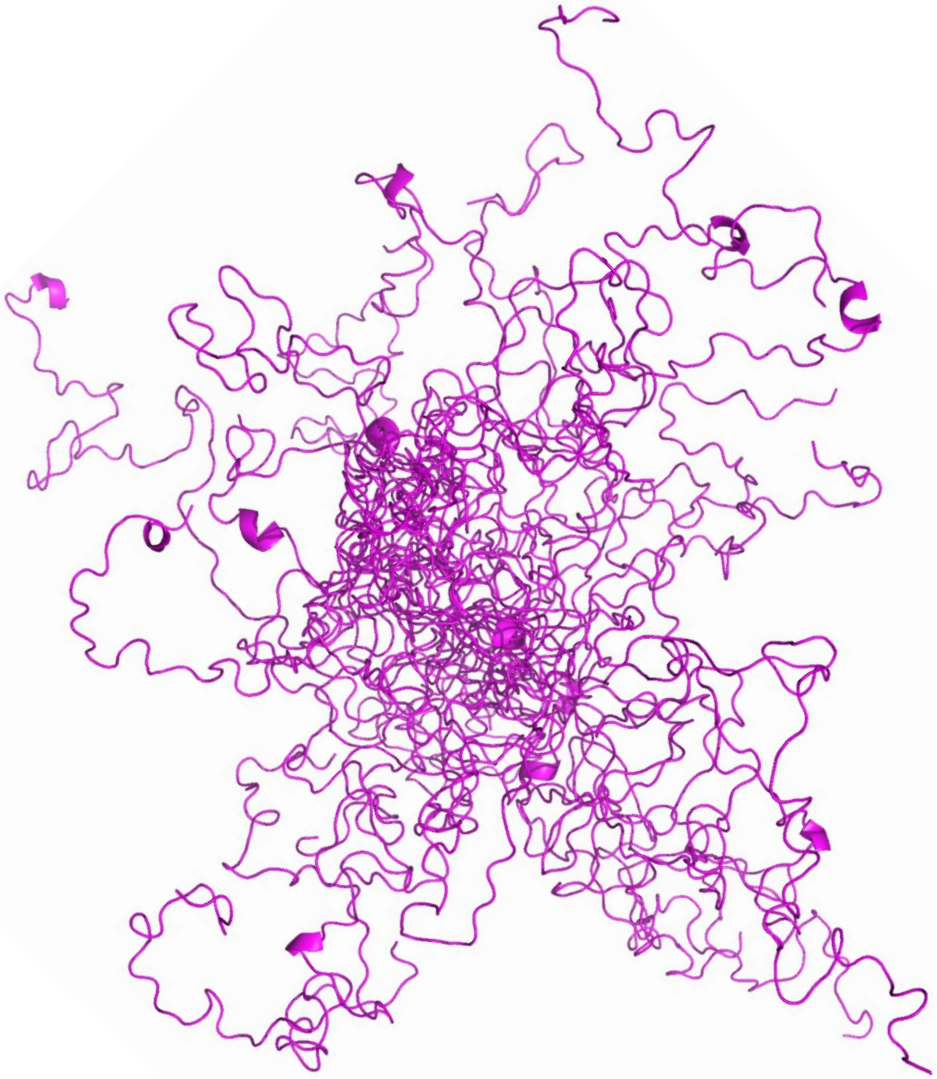
DISORDER

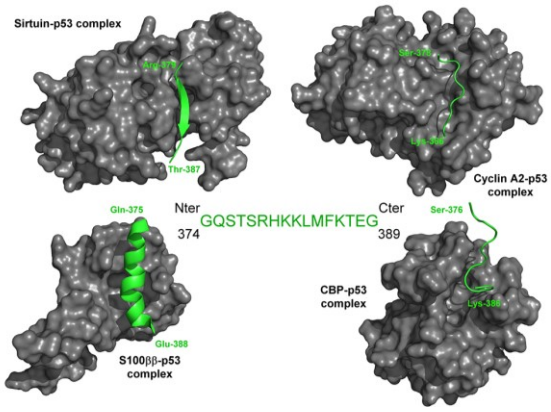


Intrinsically Disordered Proteins

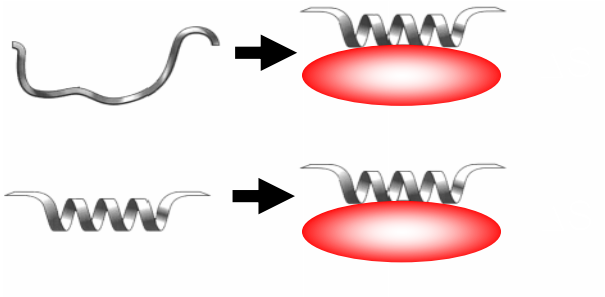
Intrinsically Disordered Proteins and Intrinsically Disordered Regions

- IDPs lack stable tertiary and/or secondary structure
- IDPs are more common in eukaryotes than in bacteria and archaea: Probably linked with their major biological complexity… Up to ~30-50% of genome
- Rich in charged and non-structuring residues while depleted in hydrophobic ones. Enriched in low complexity and compositionally biased sequences
- IDPs are the target of the majority of PTM: Phosphorylation, Glycosylation…
- IDPs are submitted to a strong evolutionary activity
- Disordered regions predominate in alternatively spliced regions
- Key elements in cancer, cardiovascular and neurodegenerative pathologies
- Interactome hubs are enriched in disordered regions

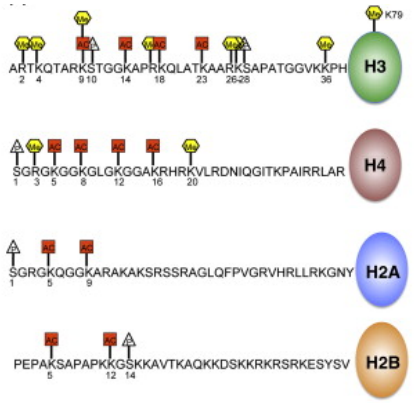
Why Disordered?



Specific but Promiscuous



Fine tuning of the thermodynamic properties



Accessible to PTM

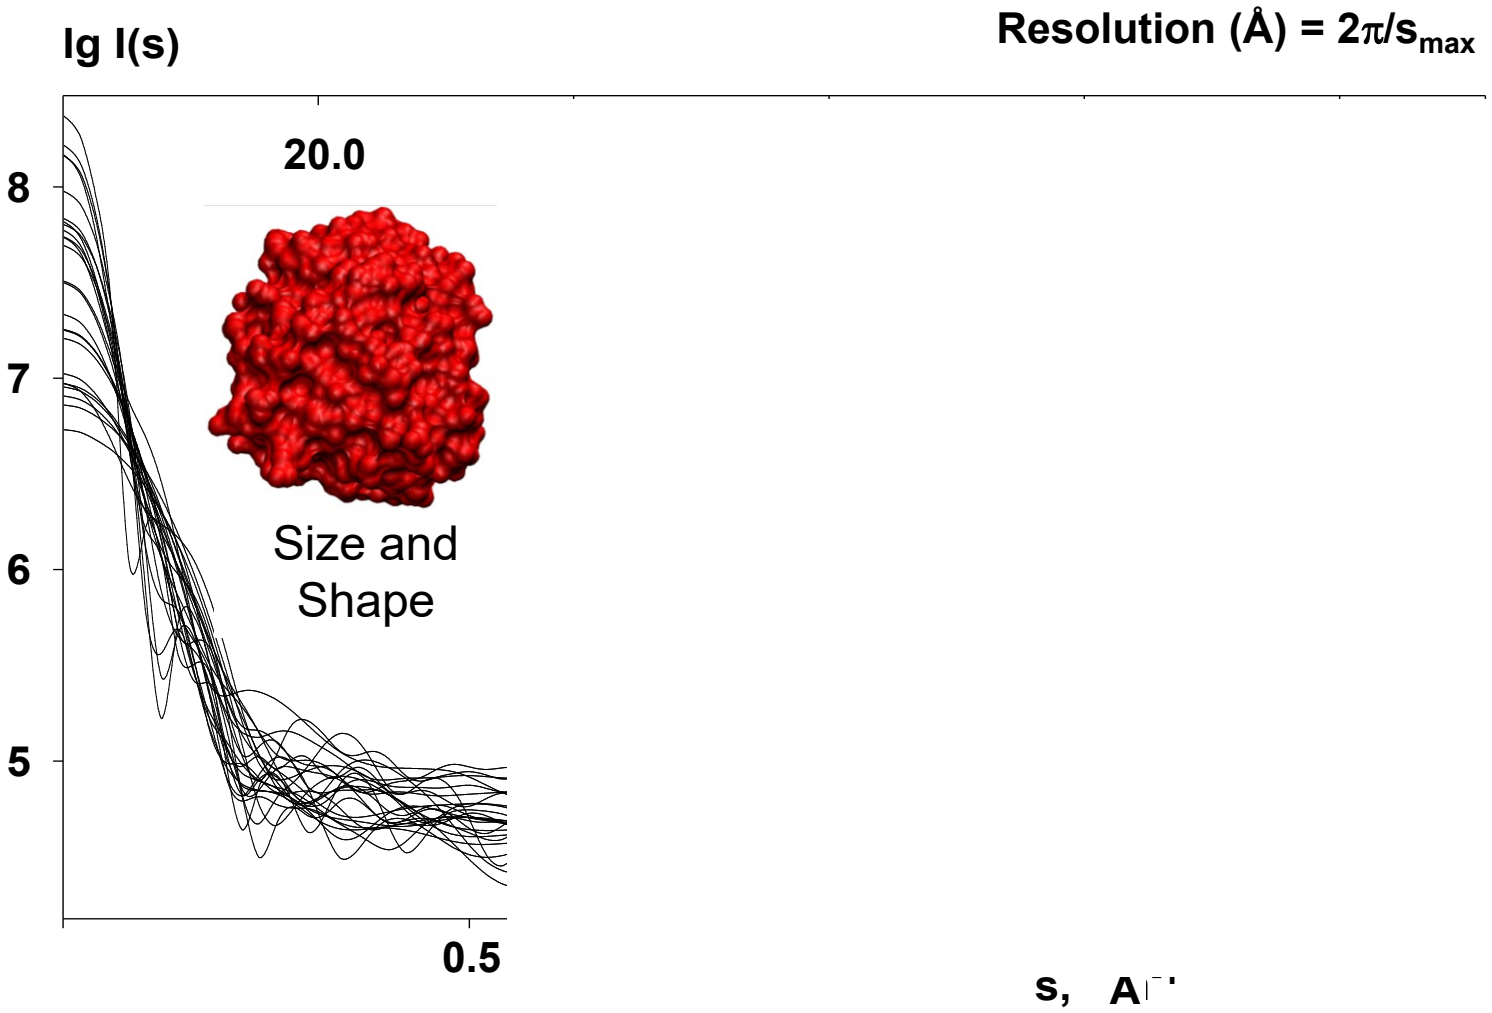
SAXS in Flexible Proteins

A Great Opportunity for SAS

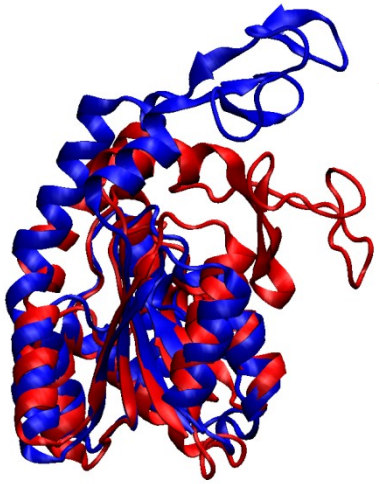
In flexible proteins the measured SAXS curve is the weighted average of all conformations present in solution

$$\langle I(s) \rangle = \Sigma v_i \, I_i(s)$$

Small Angle X-Ray Scattering Resolution

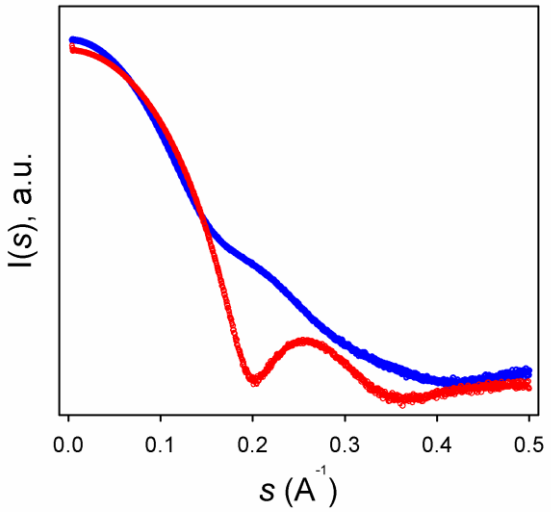


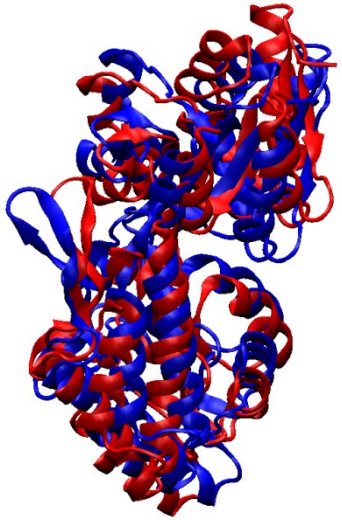
What does it mean Resolution in SAXS?



Adenylate Kinase

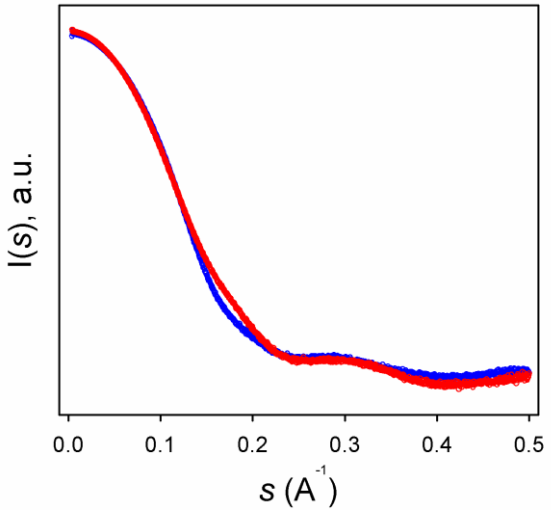
RMSD = 7.0 Å





Maltose Binding Protein

RMSD = 3.8 Å

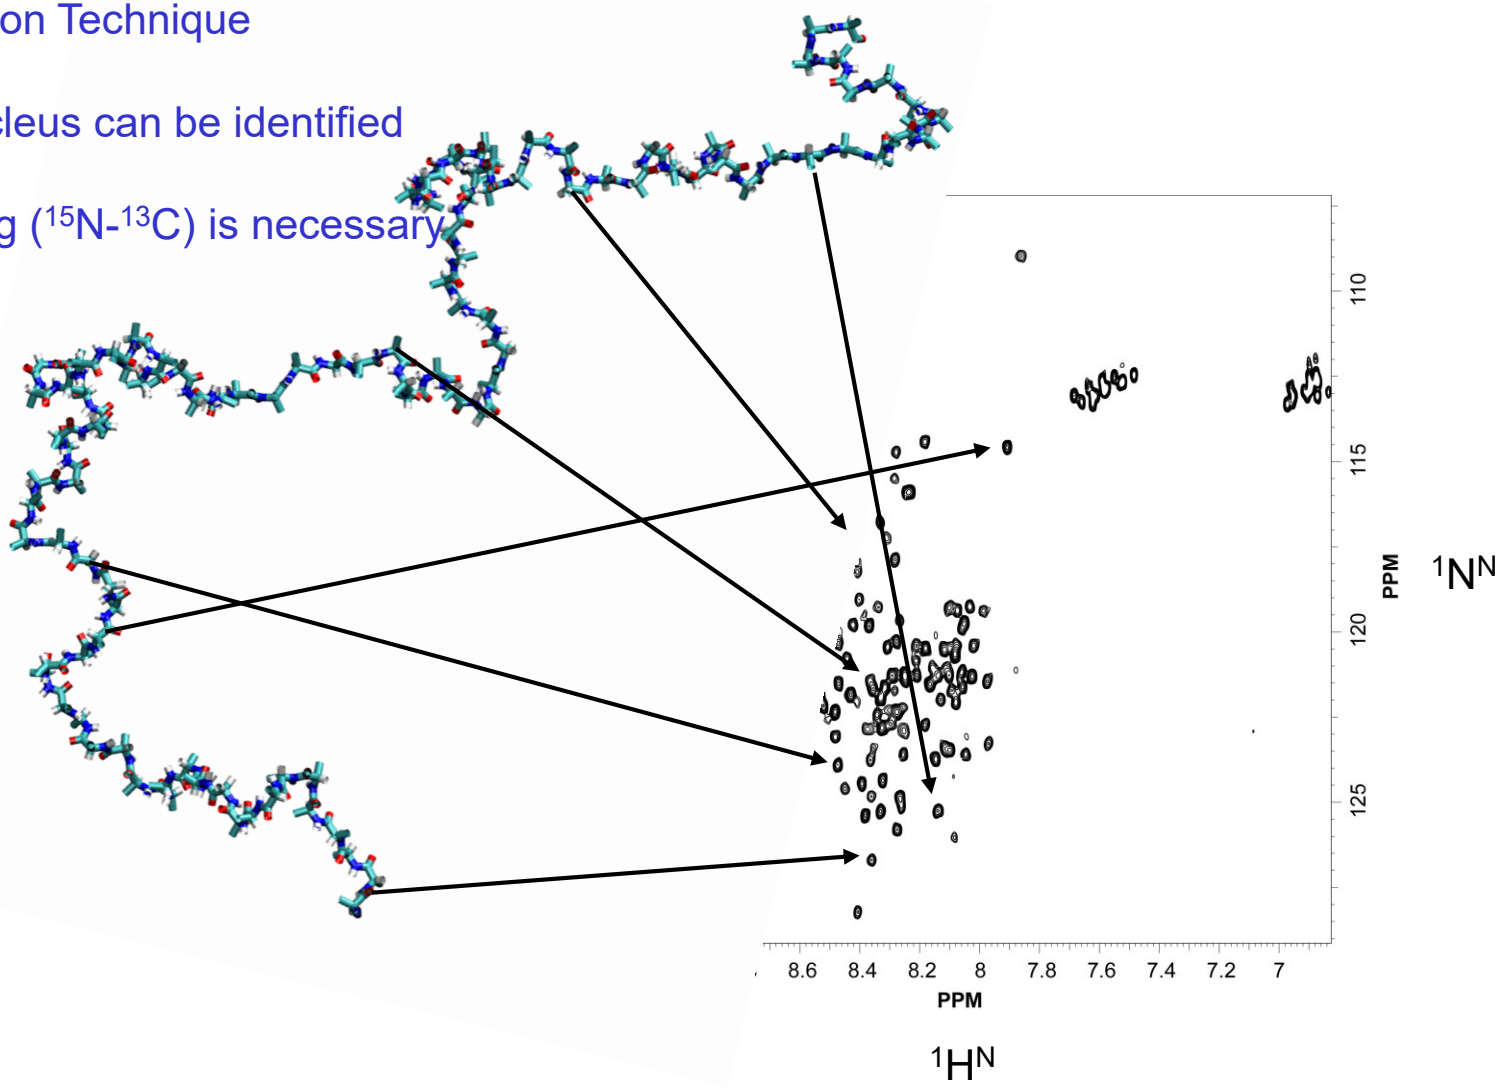


Nuclear Magnetic Resonance

Atomic Resolution Technique

Each active nucleus can be identified

Isotopic labelling (^{15}N-^{13}C) is necessary



NMR a versatile Source of Structural Information

Local Conformations
Chemical Shifts, J-Couplings

Interatomic Distances
^{1}H-^{1}H NOEs, PREs, Pseudocontact Shifts

Orientational Restrictions
RDCs, Relaxation (R_2/R_1), Pse

Overall Size
Diffusion Coefficie ional Diffusion Tensor), RDCs (Alignment Tensor)

Time-Sc

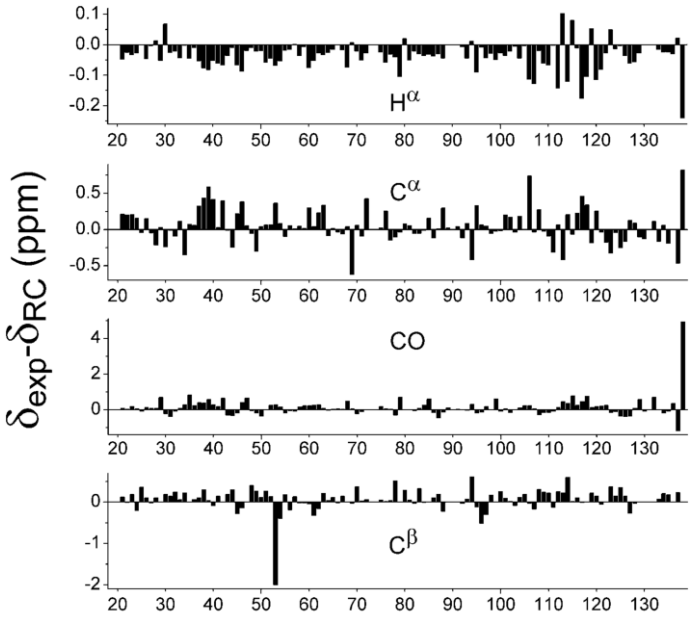
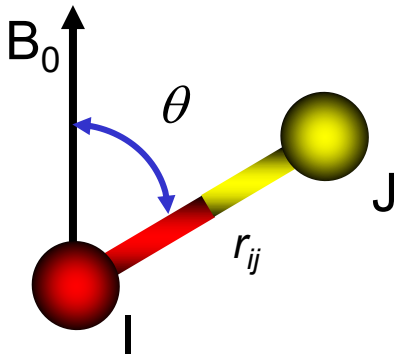
Identification of transiently formed seconday structural elements

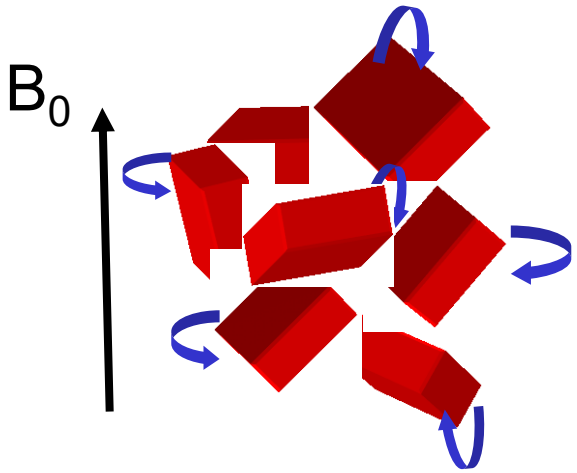


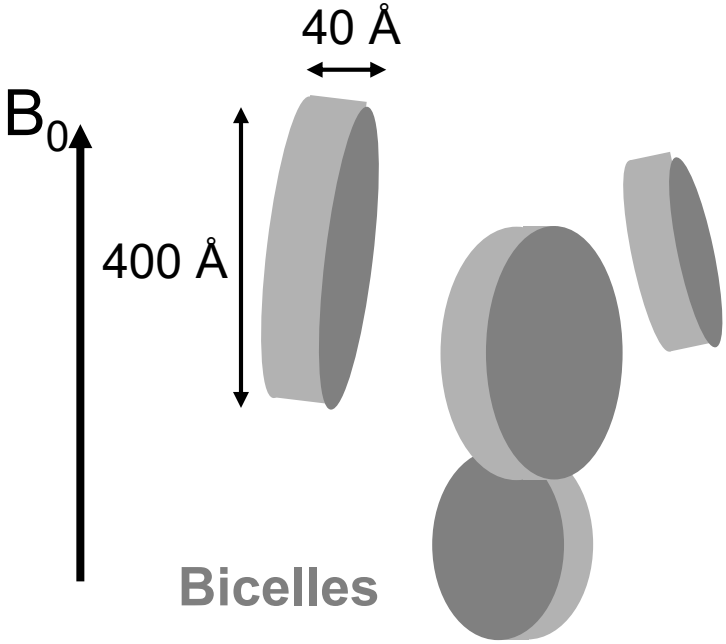
Kiss1 residue number

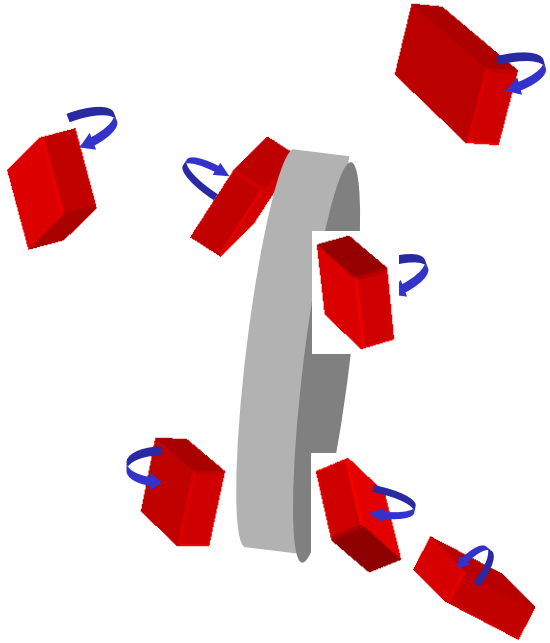
Residual Dipolar Couplings (RDCs) in Partially Aligned Systems

$$D_{ij} = -\frac{\gamma_i \gamma_j \mu_0 h}{8\pi^3}\left\langle \frac{P_2(\cos\theta(t))}{r_{ij}^3} \right\rangle$$



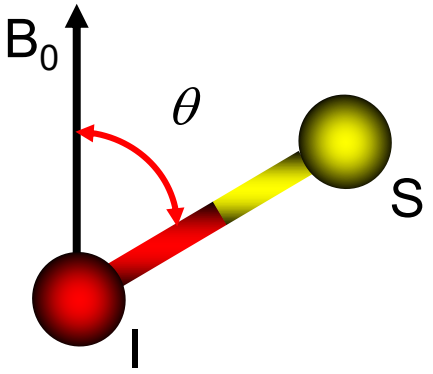






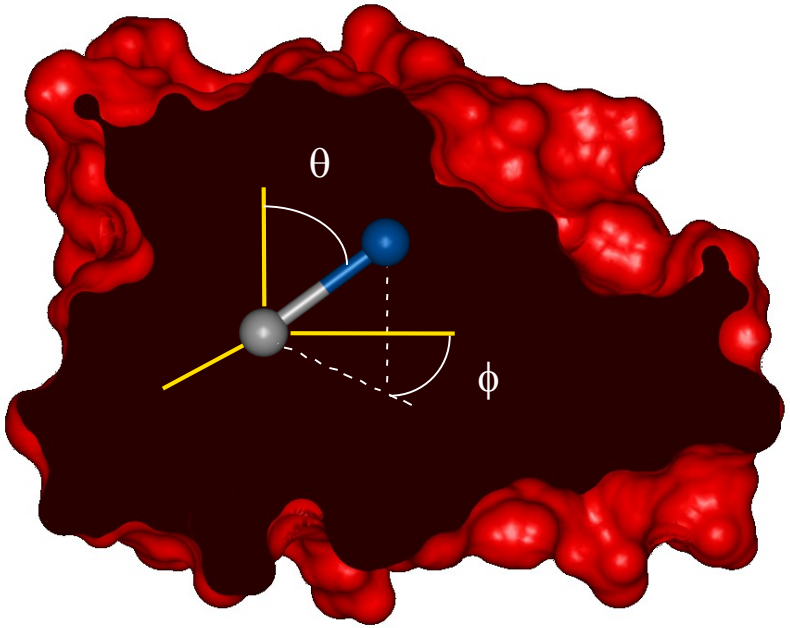
Tjandra, N.; Bax, A. *Science*, **1997**, *278*, 1111-1114.

Residual Dipolar Couplings by NMR



$$D_{ij} = -\frac{\gamma_i \gamma_j \mu_0 h}{8\pi^3}\left\langle \frac{P_2(\cos\theta(t))}{r_{ij}^3} \right\rangle$$

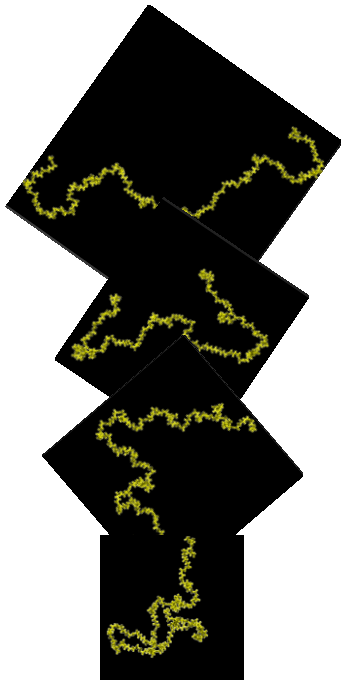
$$D_{ij} = -S\frac{\gamma_i \gamma_j \mu_0 h}{16\pi^3 r_{ij}^3}\left[A_a\left(3\cos^2\theta - 1\right) + \frac{3}{2}A_r \sin^2\theta\cos 2\varphi\right]$$

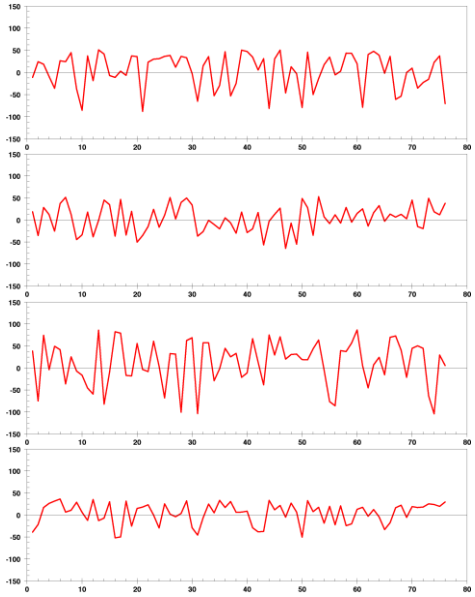


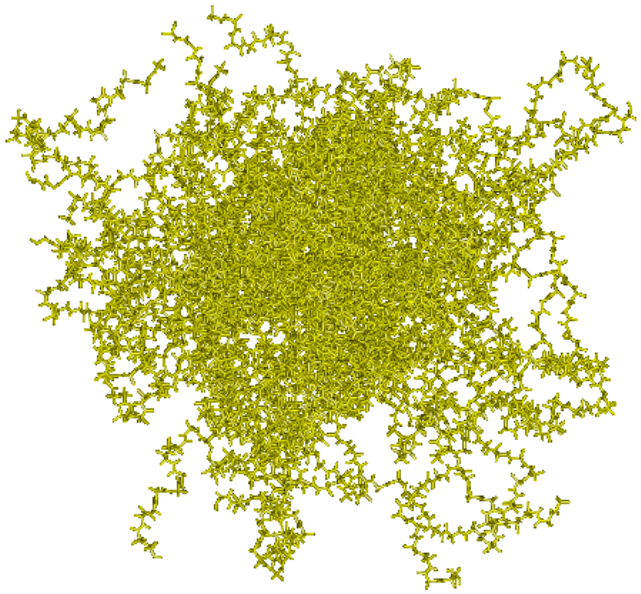
Residual dipolar couplings depend on the orientation of internuclear vectors relative to the alignment frame

RDCs are a valuable source of information to study structure and dynamics of biomolecules

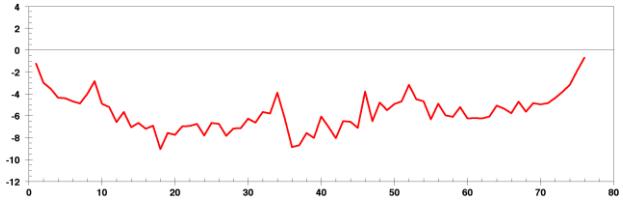
RDCs in Flexible Proteins





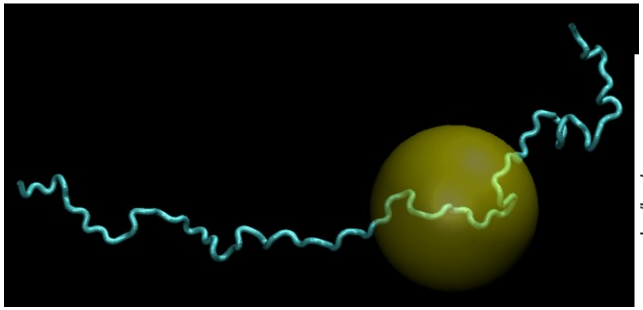


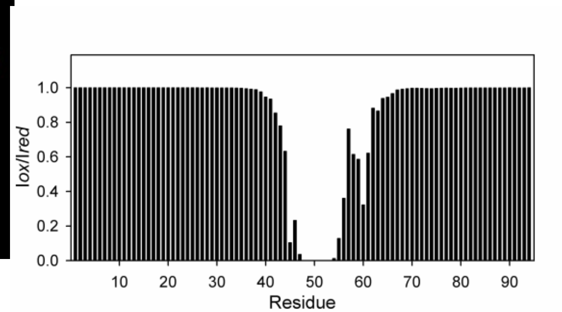
$\langle D_{ij} \rangle$



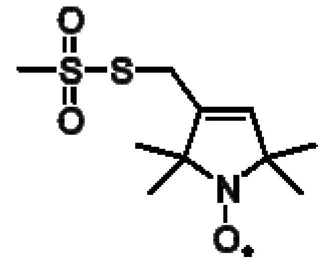
RDCs are the averaged value for all conformations in the ensemble

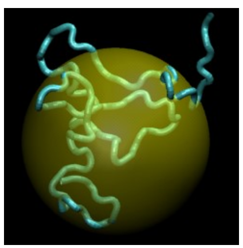
Paramagnetic Relaxation Enhancement (PRE)

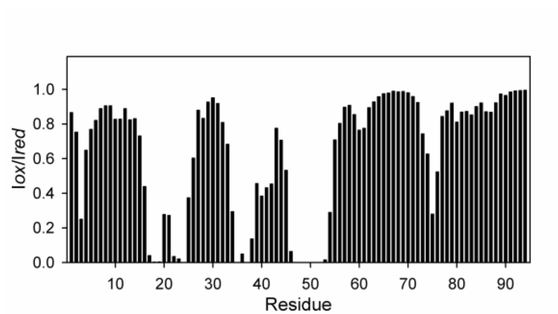




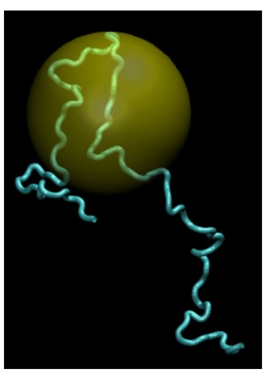
Free electron Radical attached to a Cys mutant

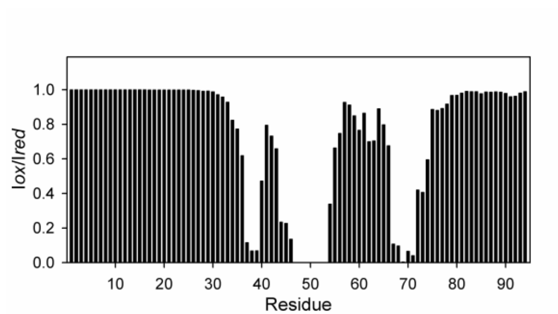






Residues in the proximity experience an enhancement of their R_2 relaxation



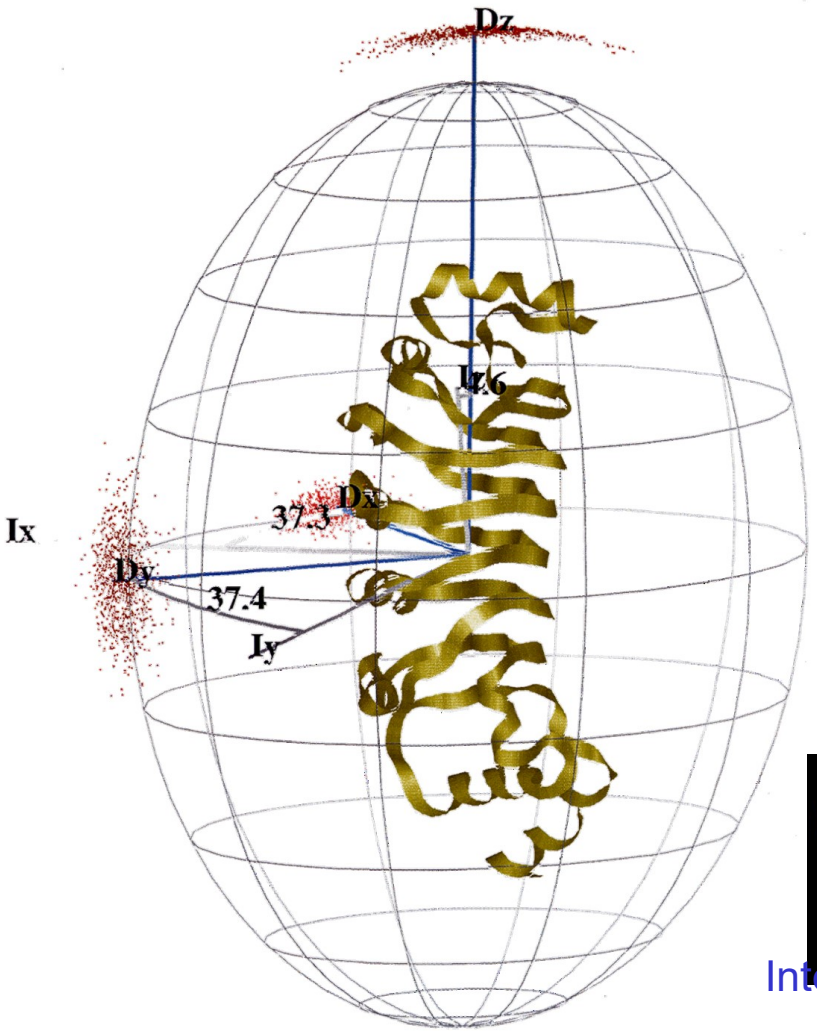


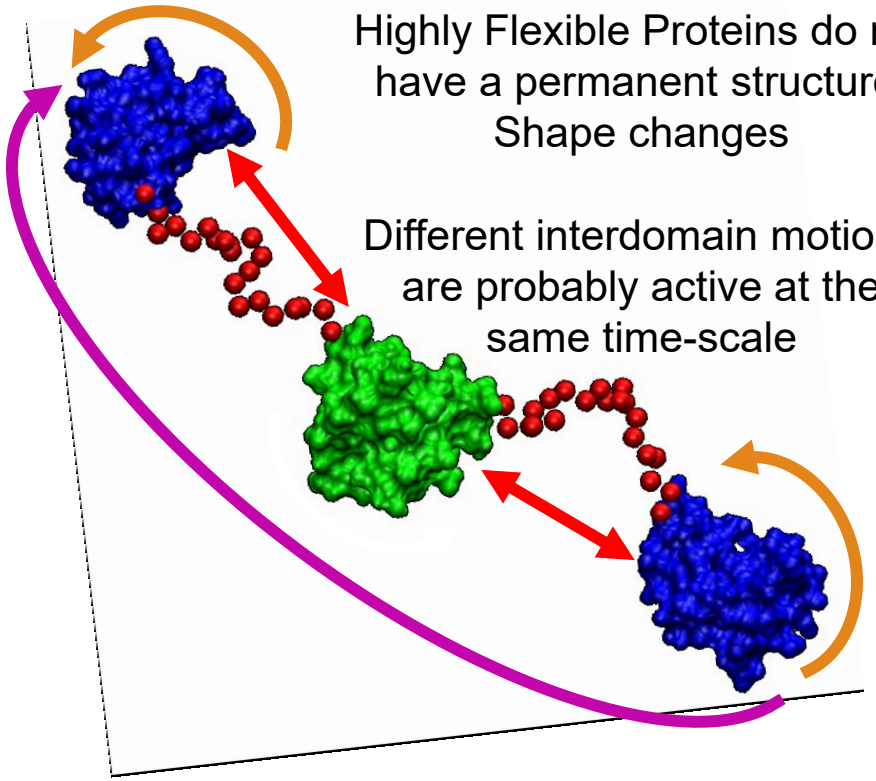
Effect up to r < 25 Å
r^6 dependence

Although it is a relaxation phenomena, in ensembles properties are normally averaged

Protein Dynamics from Relaxation Rates

Hydrodynamic Properties
Rotational Diffusion Tensor (ns)





Highly Flexible Proteins do not have a permanent structure. Shape changes

Different interdomain motions are probably active at the same time-scale

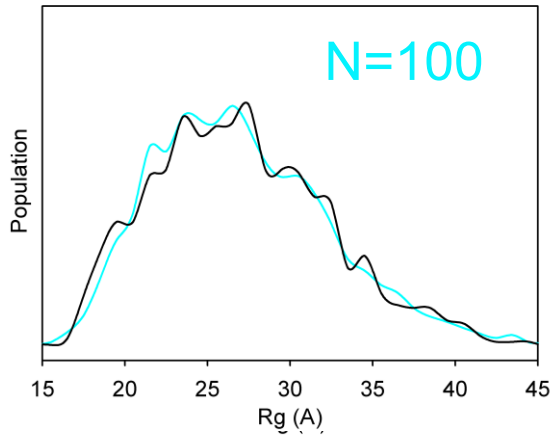
Structural Meaning of the Selected Conformations

How many structures have to be used? It depends on the degree of flexibility



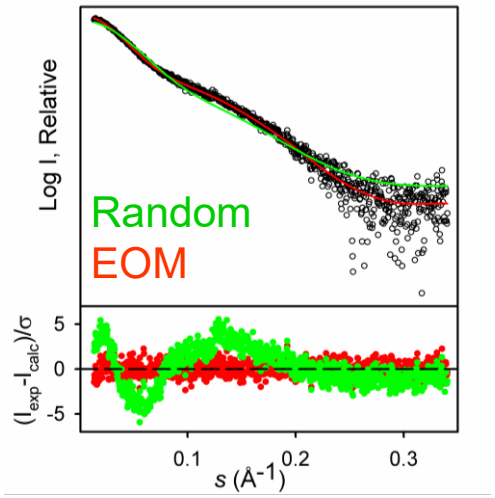
It is tempting to look at the structures at atomic/residue level… Don't do this because (Remember that) SAXS is a low resolution technique and the information content is limited… Only the size/shape of the molecule can be recovered

Structures collected are simply a TOOL to describe the size/shape distributions...

If certain structure is collected at each run… It does not mean that it is prevalent in solution

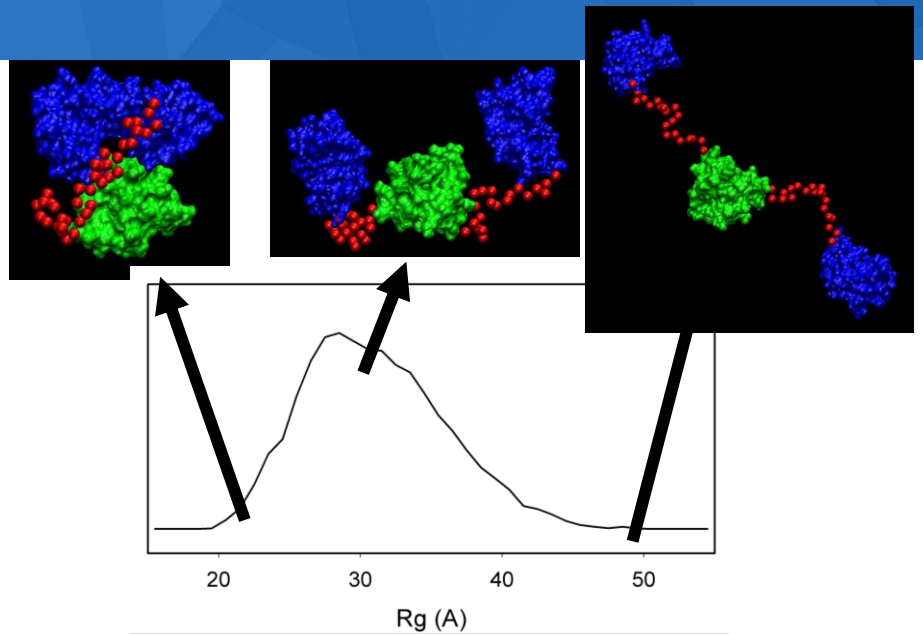
Structural interpretation can ONLY be done if the fit is from excellent to perfect!!!

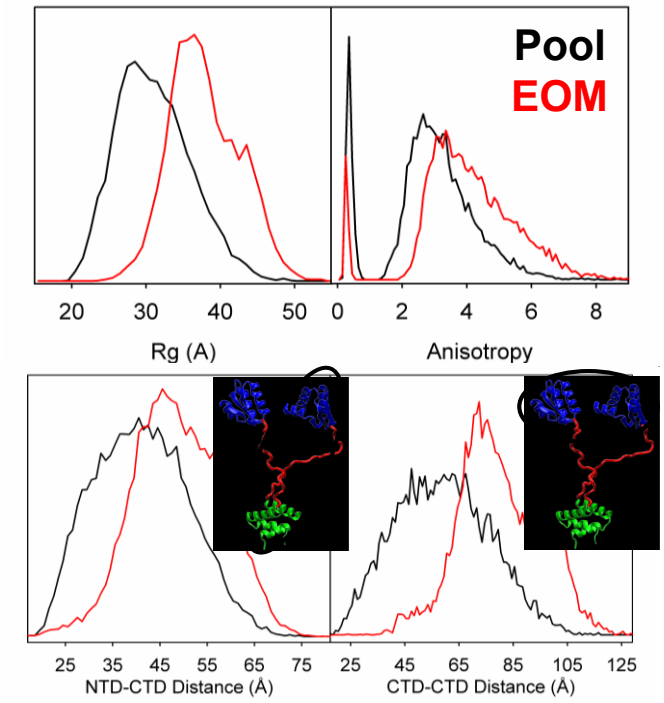
Ribosomal L12



Three samples at 7, 15 and 20 mg/ml were measured and merged

Data measured at X33 Beamline in DESY-Hamburg





Although highly dynamic, L12 samples a reduced conformational space, and mainly adopts highly elongated (anisotropic) structures.

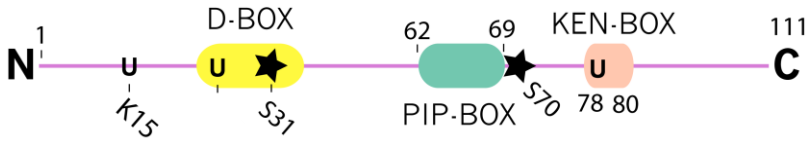
This induces large distances between both CTD domains that leave the NTD dimer in the middle

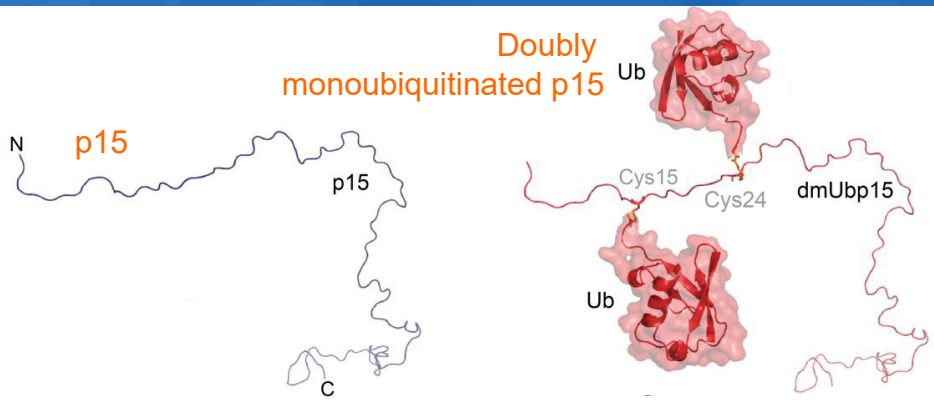
The linker is partially structured

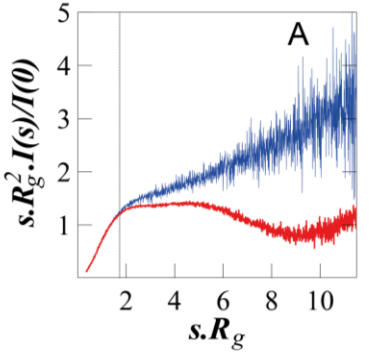
Bernadó et al. Biophys. J. 2010, 98, 2374

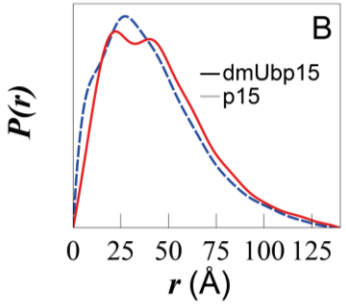
Col. D. Svergun, M. Akke, M. Tchorzewski

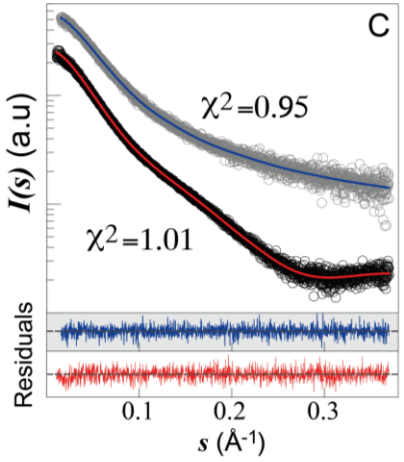
Doubly Monoubiquitinated p15

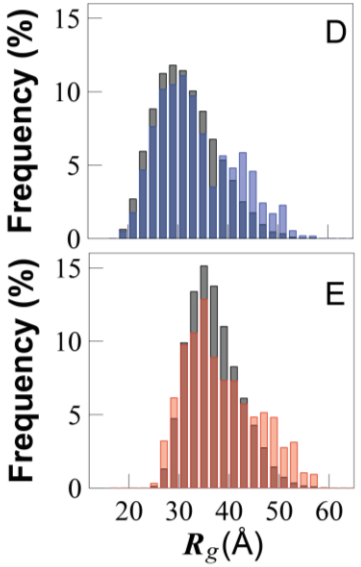


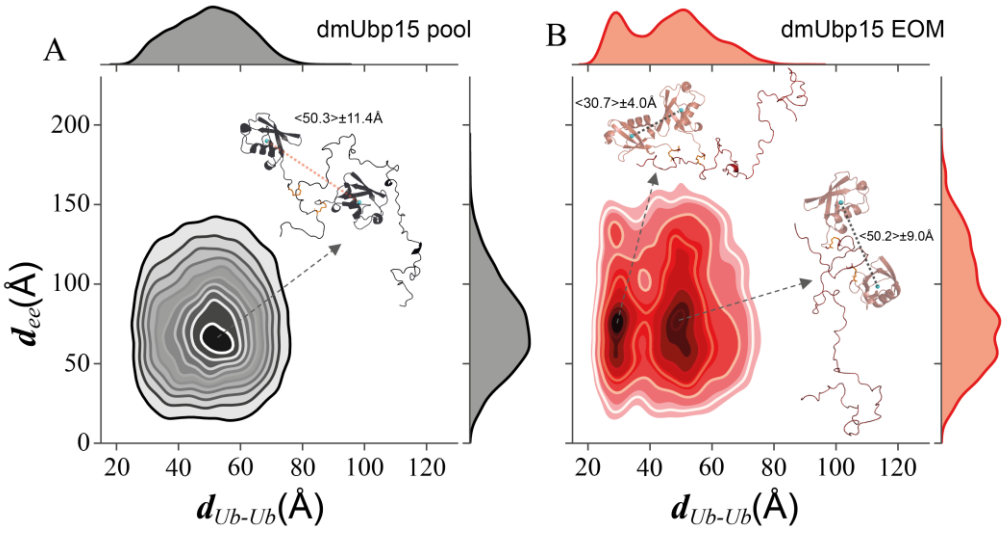












The EOM analysis indicates that both ubiquitins form transient dimers when grafted to p15

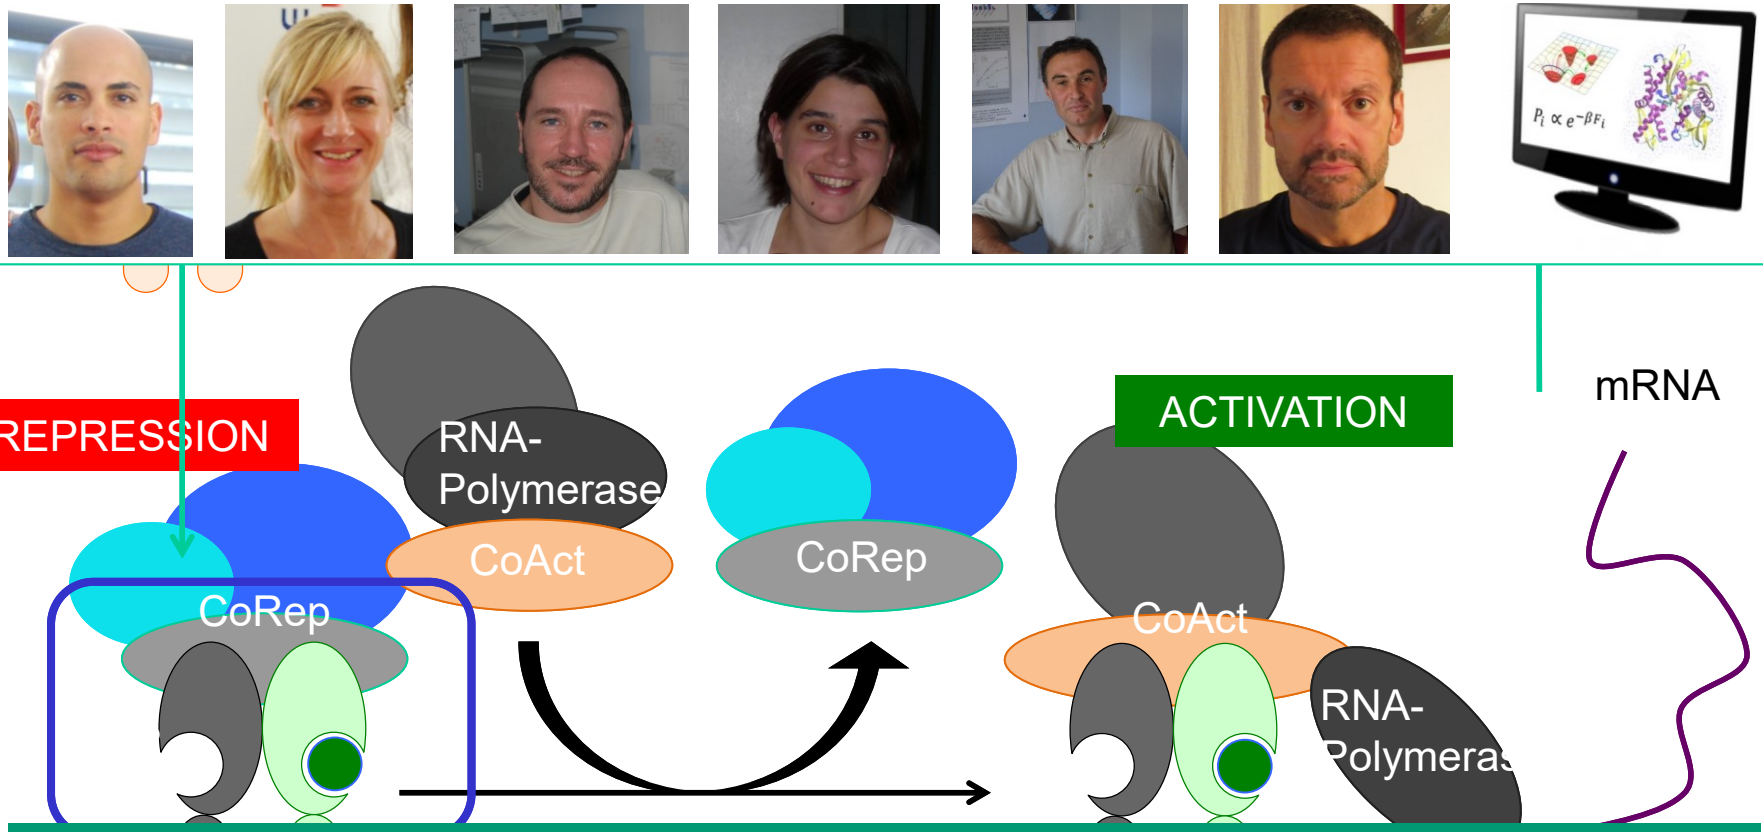
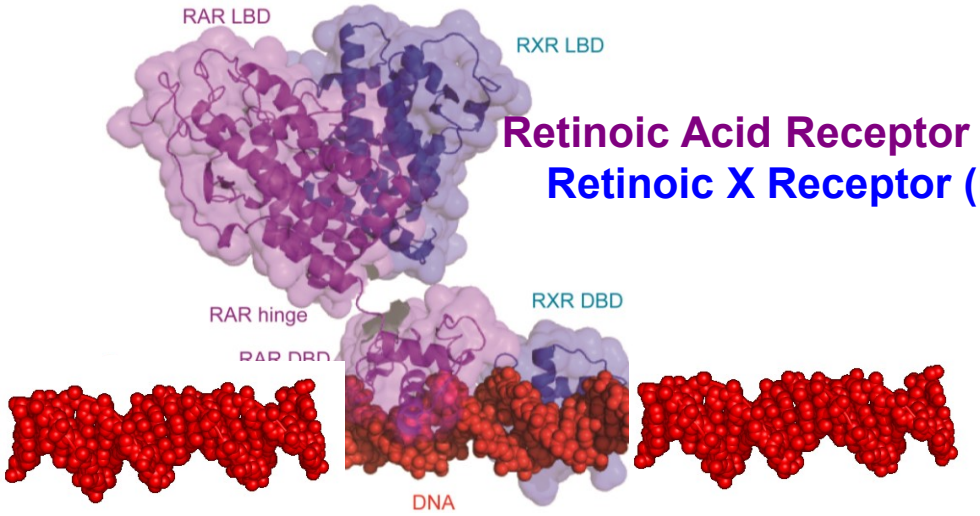
Regulation of the Retinoic Acid Nuclear Receptor

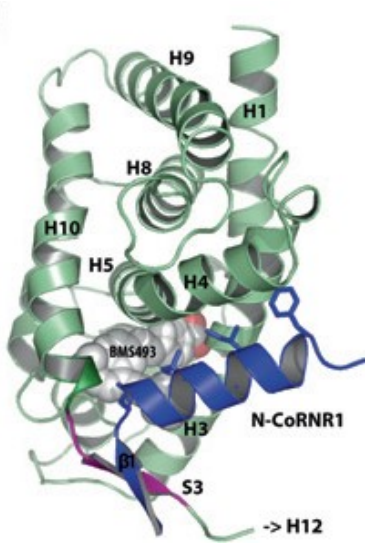


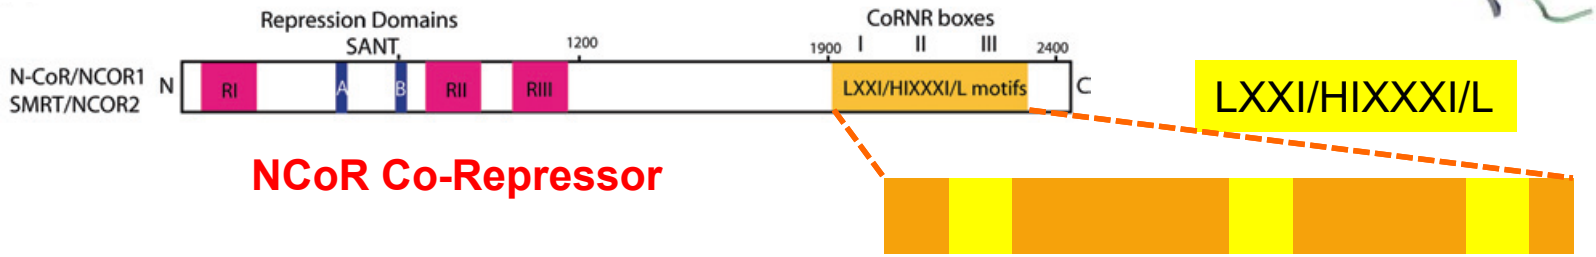
Cordeiro, T.N. ; Sibille, N. ; Germain, P. ; Barthe, P. ; Boulahtouf, A. ; Allemand, F. ; Bailly, R. ; Vivat, V. ; Ebel, C. ; Barducci, A. ; Bourguet, W. ; le Maire, A.* ; Bernadó, P.* *Interplay of protein disorder in retinoic acid receptor heterodimer and its corepressor regulates gene expression,* **Structure**, 2019, 27, 1270.

Retinoic Acid Receptor (RAR) / Retinoic X Receptor (RXR)

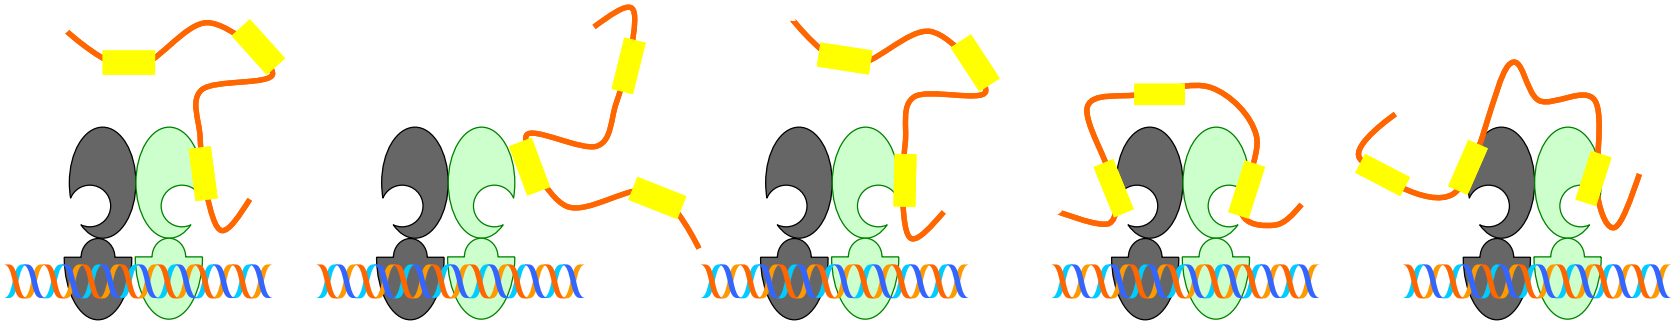


Retinoic Acid Receptor (RAR)
Retinoic X Receptor (RXR)

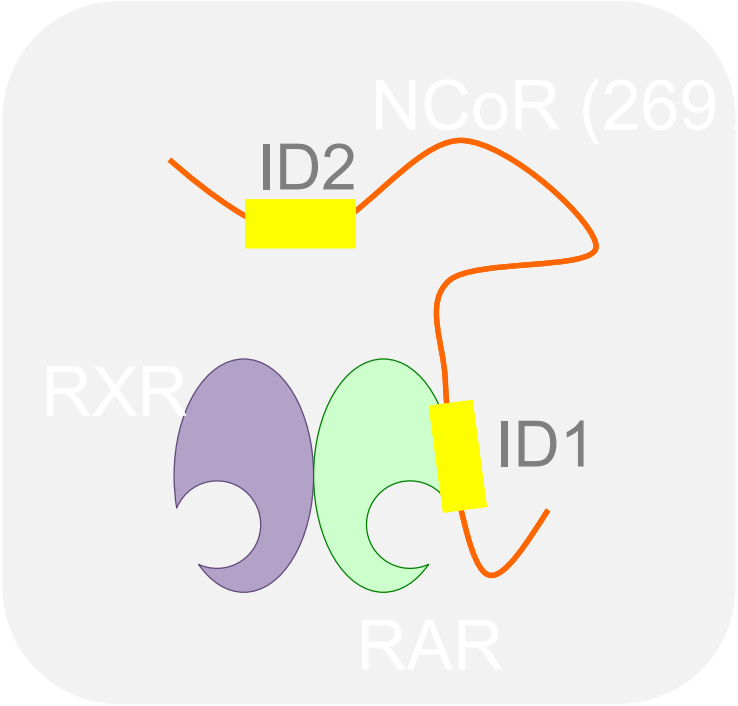




NCoR Co-Repressor



Questions

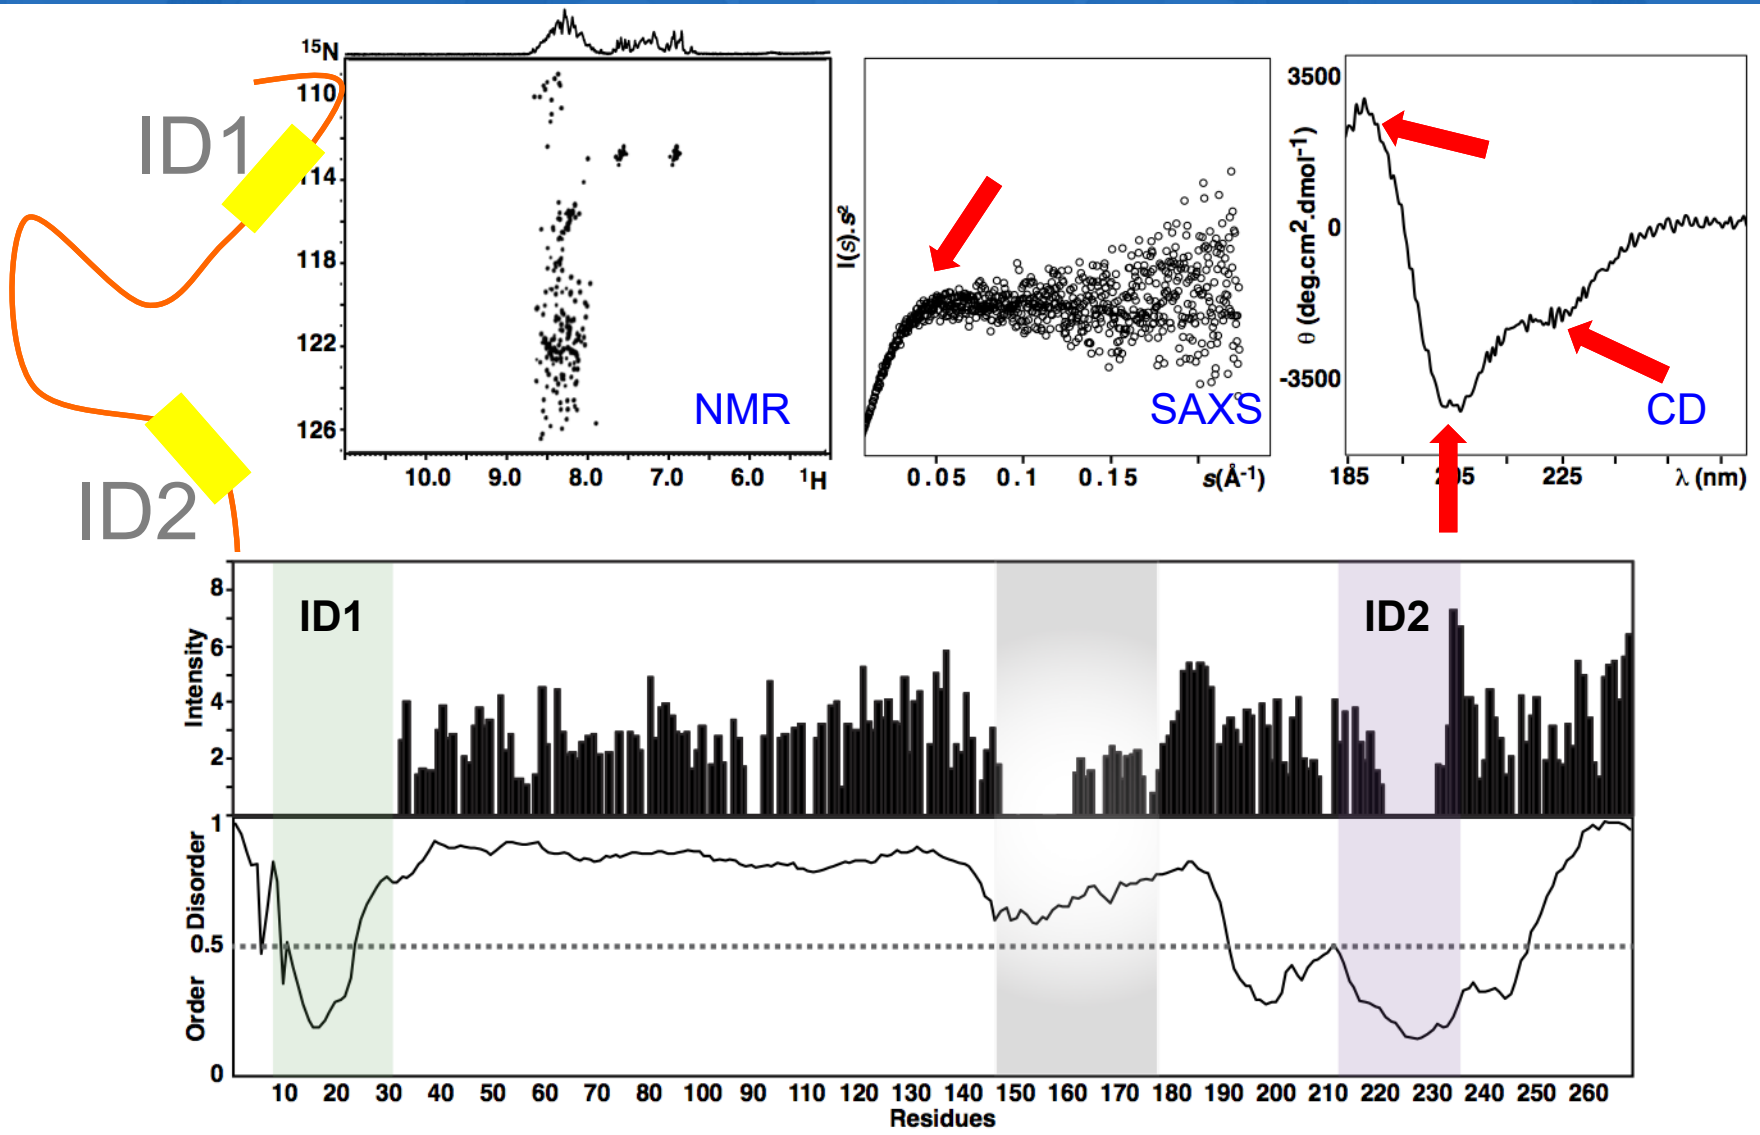


Relevant conformational state in solution?

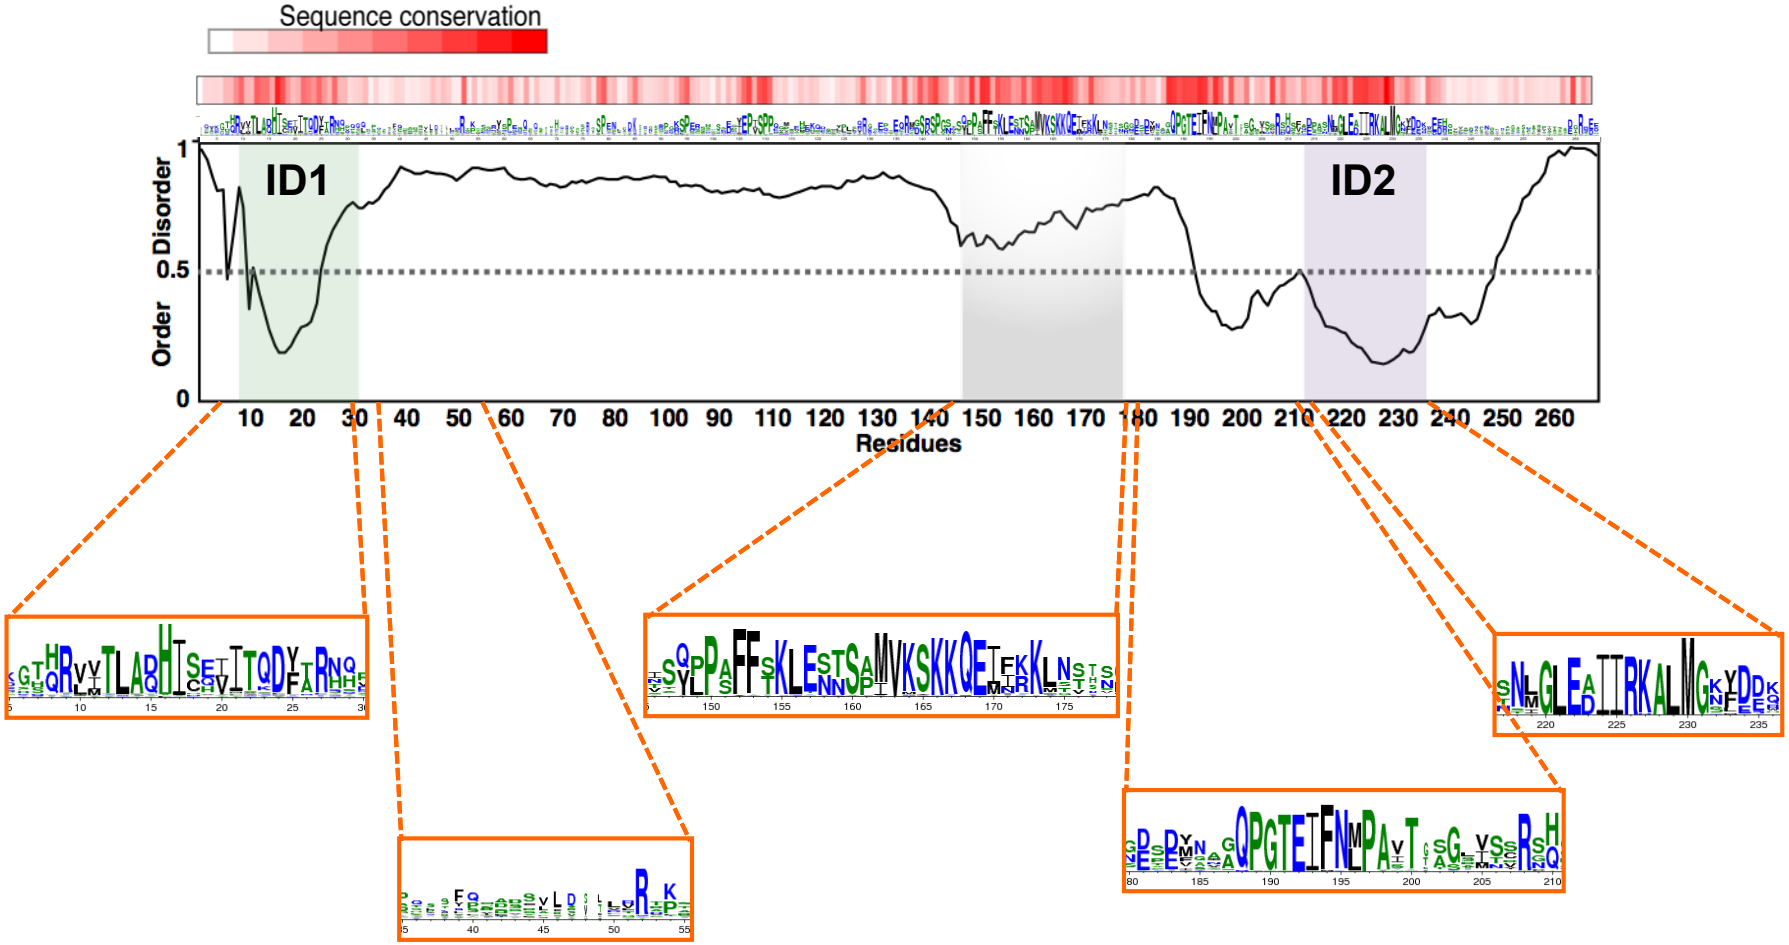
How this scenario is modified by ligands?

How the transition from repressive to active states is achieved?

NCoR is an IDP… but not a Random Coil



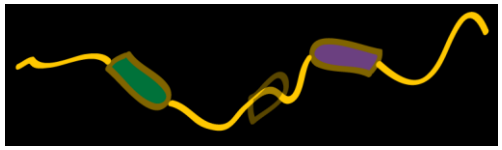
Sequence Conservation in NCoR

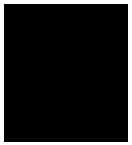


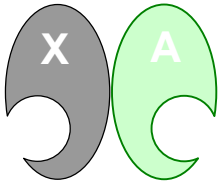
Long-Range Contacts & Co-Evolution

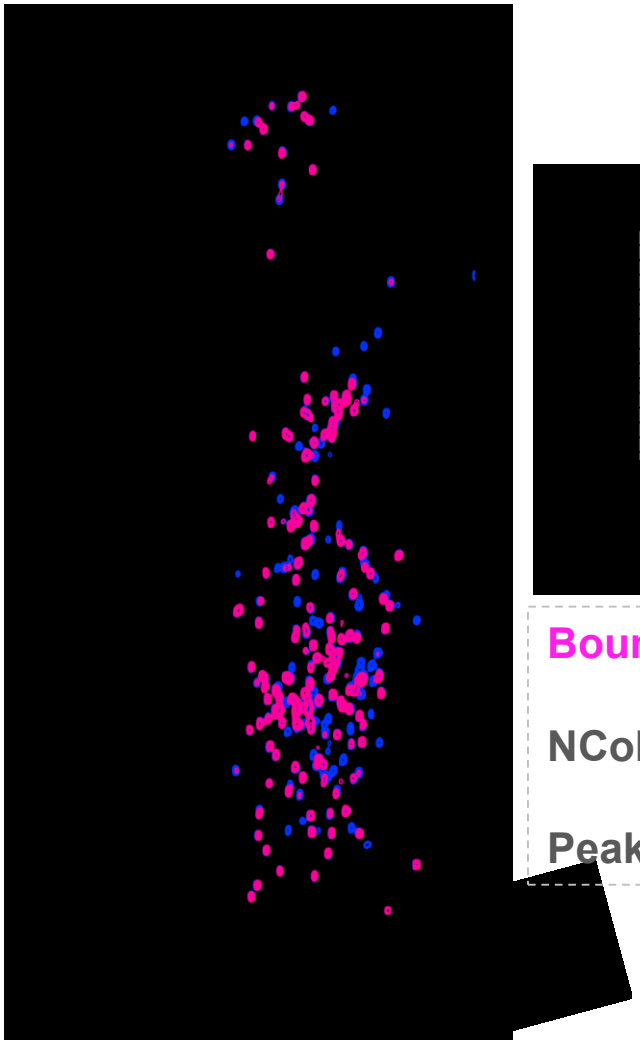
N-CoR is largely a disordered protein with partially structured regions and long-range contacts within the C-terminal region of NCoR

NCoR in Complex with RAR/RXR



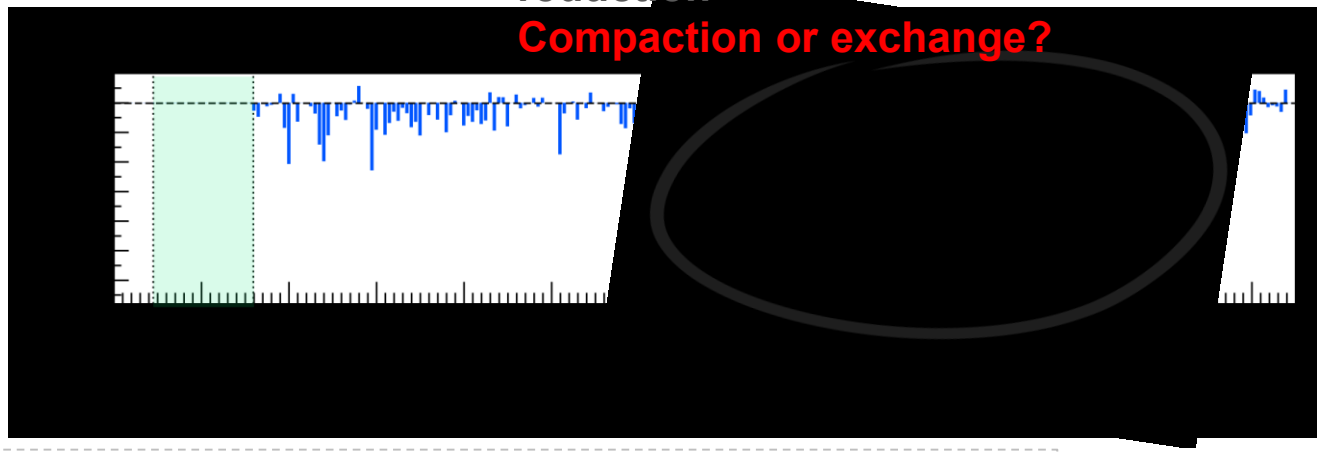






Region connecting IR and ID2 displays a important intensity reduction

Compaction or exchange?

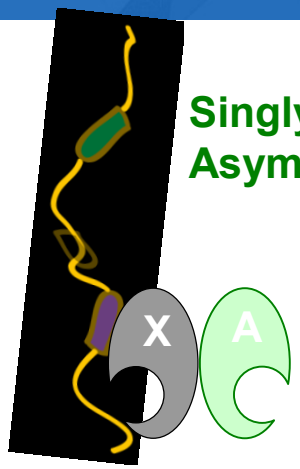


Bound and **Free** spectra are superimposable.

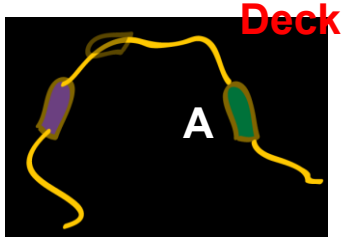
NCoR is essentially disordered in bound state.

Peak Intensities decrease in a heterogeneous way

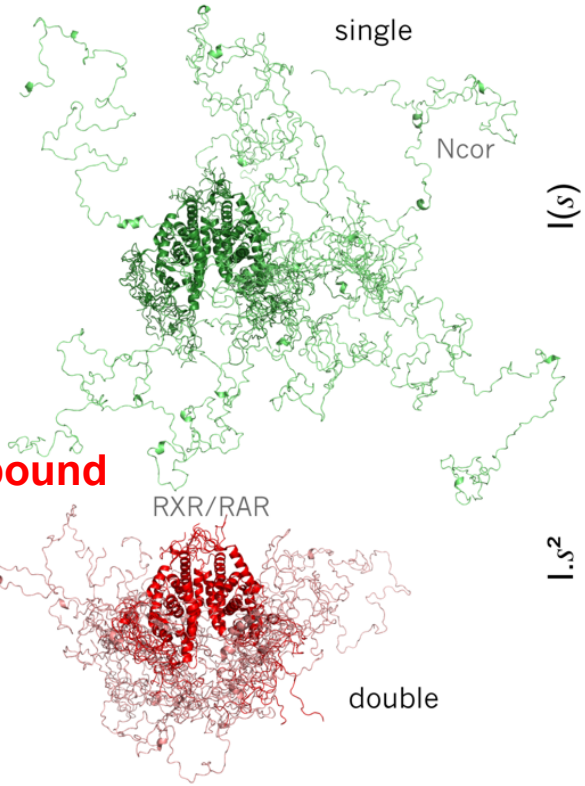
Modeling the interaction of RXR/RAR with NCoR

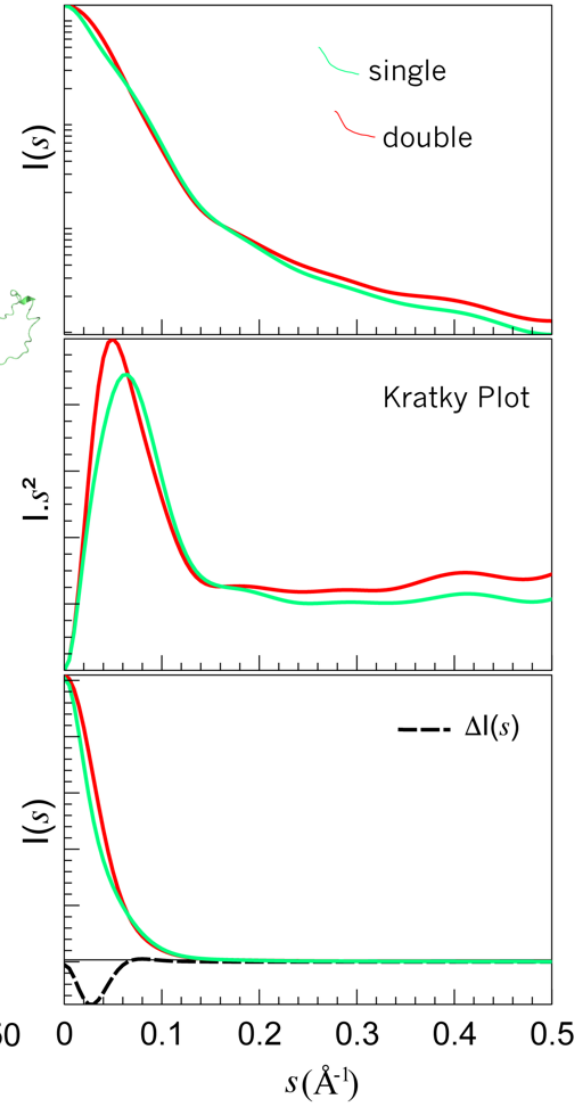


Singly bound
Asymmetric



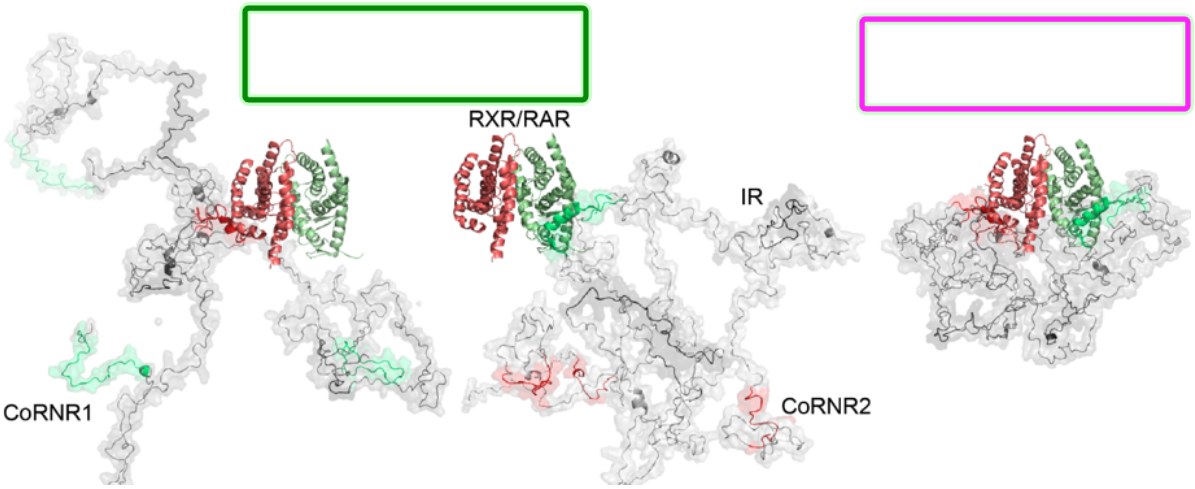
Doubly bound
Deck

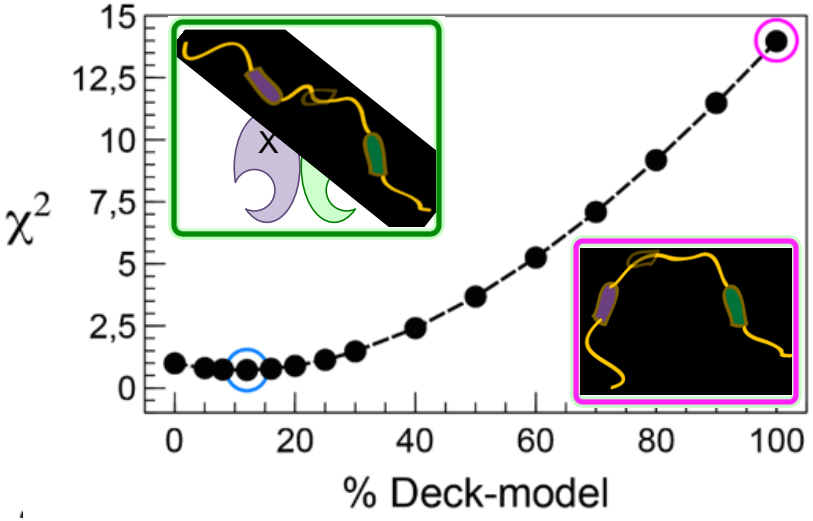


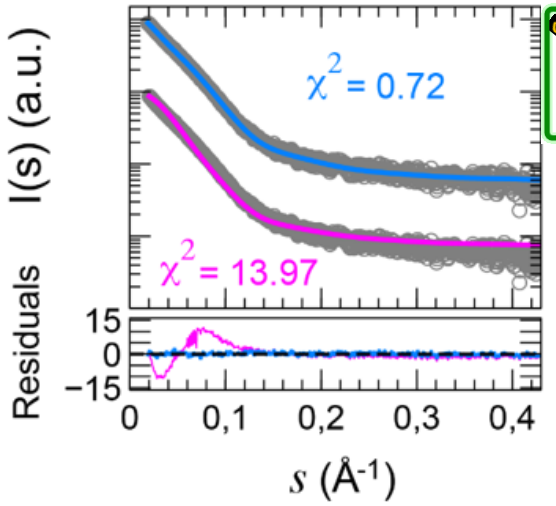


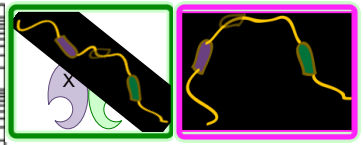
SAXS discriminates between singly- and doubly-bound scenarios

Interaction of RXR/RAR with NCoR









An equilibrium between singly- and doubly-bound scenarios is observed

Conclusions

- In highly flexible proteins, NMR provides the conformational sampling at residue level. SAXS provides the overall size and shape.

- Synergistic application of NMR and SAXS (with the help of computational tools) provides more accurate structural/dynamic models for flexible proteins…

- SAXS provides information about large-amplitude motions in biomolecules and reaches novel and biologically relevant information.

- SANS combined with amino acid specific labelling provides insights into the structure of low-complexity regions in proteins.

- Progress in the structural interpretation of SAXS data (in terms of conformational dynamics) will come from the development of theoretical methods to generate and perturb 3D structures…
