BornAgain - software for simulating and fitting reflectometry, off-specular scattering and GISAS

BornAgain is an open-source research software, under active development at the Jülich Centre for Neutron Science at Heinz Maier-Leibniz Zentrum Garching. Initially written for GISAS, it is currently being extended to reflectometry and off-specular scattering. With its GUI and Python frontends, it allows users to compose arbitrarily complex sample models. Neutron polarization is fully supported.
