Neutron & X-ray Reflectometry

Wednesday, 18 March 2026 10:30 (1 hour)

Neutron and x-ray reflectometry are complementary methods that allow the study of thin films and interfaces. I will discuss the basic principles of reflectometry experiments and data analysis. From specular reflectivity density profiles long the normal of interfaces can be extracted, while off-specular and grazing incidence scattering provides information about in-plane correlations. Examples in hydrogen storage, magnetism and polymer science will be presented.

Presenter: WOLFF, Maximilian
